Dear Mr. Nili:

In accordance with Caltrans Contract No. 07A2729 and Task Order No. 22 dated October 25, 2012, Geocon Consultants, Inc. has performed an aerially deposited lead site investigation along U.S. Route 2 from the Glendale Boulevard undercrossing (UC) to Rosebud Avenue UC in the City of Los Angeles, California. The accompanying report summarizes the services performed, including the advancement of hand-auger borings, soil sampling, global positioning system data acquisition, laboratory analyses, and data evaluation.

The contents of this report reflect the views of the author, who is responsible for the facts and accuracy of the data presented herein. The contents do not necessarily reflect the official views or policies of the State of California or the Federal Highway Administration. This report does not constitute a standard, specification, or regulation.

Please call us if you have questions.

Sincerely,

GEOCON CONSULTANTS, INC.

EXECUTIVE SUMMARY

Geocon Consultants, Inc. performed an aerially deposited lead (ADL) site investigation along U.S. Route 2 from the Glendale Boulevard undercrossing (UC) to Rosebud Avenue UC in the City of Los Angeles, California. The objective of the investigation was to evaluate soil at the project site for the potential presence of ADL and soil pH. The California Department of Transportation (Caltrans) intends to reuse excavated soil at the project site. Caltrans will use the information from the investigation to determine soil reuse and disposal options and identify health and safety concerns during construction activities.

Lead

Soil samples collected from the surface and depths up to 5 feet were analyzed for total lead and soluble lead using the Waste Extraction Test (WET) method with citric acid as the extractant. Selected samples were further analyzed for soluble lead using a modified WET method with de-ionized water (DI-WET) as the extractant, soluble lead using the Toxicity Characteristic Leaching Procedure (TCLP), and/or pH.

Laboratory analytical results and statistical analysis using non-parametric bootstrap techniques to calculate the 90% and 95% upper confidence limits (UCLs) were used to evaluate soil reuse and disposal options. The reuse of excavated soil has been evaluated, as applicable, based on the Department of Toxic Substances Control (DTSC) requirements in the Statewide Variance.

Onsite reuse and offsite disposal of excavated soil were based upon comparison of the total lead 90% and 95% UCLs to the California Code of Regulations (CCR) Title 22 total threshold limit concentration (TTLC) of 1,000 milligrams per kilogram (mg/kg), predicted WET results to the CCR Title 22 soluble threshold limit concentration (STLC) of 5.0 milligrams per liter (mg/l) and TCLP results to Chapter 40 of the Code of Federal Regulations (40 CFR) Resource, Conservation and Recovery Act (RCRA) hazardous waste threshold of 5.0 mg/l.

Soil excavated to a depth of 5.0 feet or shallower would be classified as a hazardous waste since the 90% UCL-predicted WET lead concentrations are greater than the STLC for lead of 5.0 mg/l. Soil excavated from the top 5.0 feet or shallower would not be classified as RCRA hazardous since the 90% UCL-predicted TCLP lead concentrations are less than the RCRA hazardous waste threshold of 5.0 mg/l. Based on the DI-WET soluble lead and pH results, the top 5.0 feet or shallower of soil may be reused onsite in accordance with the DTSC Variance (as Caltrans Type Y-1) by placing the lead-impacted soil under at least one foot of non-hazardous soil or a pavement structure maintained by Caltrans.

If excavated soil from the top 0.5 foot will not be reused onsite, then excavated soil from the top 0.5 foot would likely be disposed of as a RCRA hazardous waste since the 95% UCL-predicted TCLP lead concentration is greater than the RCRA hazardous waste threshold of 5.0 mg/l.

Based on the 95% UCL-predicted TCLP lead concentrations of less than 5.0 mg/l, soil excavated from the top 1.5 to 5.0 feet will not likely be disposed of as a RCRA hazardous waste. Thus, if excavated soil from the top 1.5 to 5.0 feet will not be reused onsite, then the excavated soil should be either (1) managed and disposed of as a California hazardous waste or (2) stockpiled and resampled to confirm waste classification in accordance with specific disposal facility acceptance criteria, if applicable.

Caltrans should notify the contractors performing the construction activities that elevated concentrations of lead are present in onsite soil and that appropriate health and safety measures should be taken to minimize the exposure of construction workers to lead.

Title 22 Metals

The one sample with the highest reported total lead concentrations was analyzed for CCR Title 22 metals. With the exception of lead, Title 22 metals were not reported at or above their respective TTLC or ten times their respective STLCs. The concentrations of metals reported in the soil sample were below their respective residential and/or industrial California Human Health Screening Levels except for arsenic, cadmium, and lead. The reported arsenic concentration is consistent with published background levels in Los Angeles County.

Cadmium was detected in the soil sample at 2.2 mg/kg, greater than the CHHSL for residential land use of 1.7 mg/kg; however, the cadmium concentration was less than the CHHSL for commercial/industrial land use of 7.5 mg/kg.

pH

Soil pH was reported to range between 5.3 and 7.5.

Worker Protection

Per Caltrans' requirements, contractor(s) should prepare a project-specific Health and Safety Plan (HSP) to prevent or minimize worker exposure to lead-impacted soil. The HSP should include a Lead Compliance Plan, and outline protocols for environmental and personnel monitoring, requirements for personal protective equipment and other appropriate health and safety protocols and procedures for the handling of lead-impacted soil.

Groundwater

One boring was advanced to a depth of 16-feet with a direct-push drilling rig to evaluate the potential presence of groundwater. Groundwater was not encountered in the boring.

AERIALY DEPOSITE LEAD SITE INVESTIGATION REPORT - OFFRAMP

1. INTRODUCTION

Geocon Consultants, Inc. performed an aerially deposited lead (ADL) site investigation along U.S. State Route 2 (SR-2) from the Glendale Boulevard undercrossing (UC) to Rosebud Avenue UC in the City of Los Angeles, California. The project location is shown on the Vicinity Map, Figure 1. The site investigation was conducted under California Department of Transportation (Caltrans) Contract No. 07A2729, Task Order (TO) No. 22, and Expense Authorization 205521, dated October 25, 2012.

1.1 Project Description

Caltrans proposes to relocate the southbound SR-2 exit ramp from Waterloo Street to the existing landscaped area adjacent to the northbound exit offramp. The proposed improvements will involve soil excavation and other earthwork activities within the project site. It is our understanding that the soil excavated for construction will be reused onsite and any excess soil will be removed from the project site for disposal.

1.2 Investigation Objective

The objective of the investigation was to evaluate concentrations of ADL in soil that will potentially be disturbed during excavation for the proposed project improvements. Caltrans will use the information obtained from the investigation to determine soil reuse or disposal options and identify health and safety concerns during proposed construction activities.

2. BACKGROUND

2.1 Hazardous Waste Classification Criteria

Regulatory criteria to classify a waste as “California hazardous” for handling and disposal purposes are contained in the California Code of regulations (CCR), Title 22, Division 4.5, Chapter 11, Article 3, §66261.24. Criteria to classify a waste as “Resource, Conservation and Recovery Act (RCRA) hazardous” are contained in Chapter 40 of the Code of Federal Regulations (40 CFR), §261.

For waste containing metals, the waste is classified as “California hazardous” when: (1) the representative total metal content exceeds or equals the respective Total Threshold Limit Concentration (TTLC); or (2) the representative soluble metal content exceeds or equals the respective Soluble Threshold Limit Concentration (STLC) based on the standard Waste Extraction Test (WET). A waste may have the potential of exceeding the STLC when the waste’s total metal content is greater than or equal to ten times the respective STLC value, since the WET uses a 1:10 dilution ratio. Hence, when a

total metal is detected at a concentration greater than or equal to ten times the respective STLC, and assuming that 100 percent of the total metals are soluble, soluble metal analysis is typically performed. A material is classified as “RCRA hazardous” when the representative soluble metal content exceeds or equals the Federal Regulatory Level based on the Toxicity Characteristic Leaching Procedure (TCLP). The TTLC value for lead is 1,000 milligrams per kilogram (mg/kg). The STLC and TCLP values for lead are both 5.0 milligrams per liter (mg/l).

The above regulatory criteria are based on toxicity. Wastes may also be classified as hazardous based on other criteria such as ignitability, corrosivity, and reactivity. For the purposes of ADL investigations, toxicity and corrosivity (e.g., chemical concentrations and soil pH values, respectively) are the primary factors considered for waste classification. Waste that is classified as either “California hazardous” or “RCRA hazardous” requires management as a hazardous waste and disposal at an appropriately permitted disposal facility.

The Department of Toxic Substances Control (DTSC) regulates and interprets hazardous waste laws in California. DTSC generally considers excavated or transported materials that exhibit “hazardous waste” characteristics to be a “waste” requiring proper management, treatment and disposal. Soil that contains lead above hazardous waste thresholds and is left in-place would not be necessarily classified by DTSC as a “waste.” The DTSC has provided site-specific determinations that “movement of wastes within an area of contamination does not constitute "land disposal" and, thus, does not trigger hazardous waste disposal requirements.” Therefore, lead-impacted soil that is scarified in-place, moisture-conditioned, and re-compacted during roadway improvement activities might not be considered a “waste.” DTSC should be consulted to confirm waste classification. It is noted that in addition to DTSC regulations, health and safety requirements and other local agency requirements may also apply to the handling and disposal of lead-impacted soil.

2.2 DTSC Variance

The DTSC issued a statewide Variance effective July 1, 2009, regarding the reuse of ADL-impacted soils within Caltrans right-of-way. Under the Variance, soil that is classified as a non-RCRA hazardous waste, based primarily on ADL content, may be suitable for reuse within Caltrans right-of-way. ADL soil that is classified as a RCRA hazardous waste is not eligible for reuse under the Variance and must be disposed of as a RCRA hazardous waste (Caltrans Type Z-3).

ADL soil reused under the Variance must always be at least 5.0 feet above the highest groundwater elevation and, depending on lead concentrations, must be covered with at least one foot of non-hazardous soil or a pavement structure. The ADL soil may not be placed in areas where it might contact groundwater or surface water (such as streams and rivers), and must be buried in locations that are protected from erosion that may result from storm water run-on and run-off.

Review of the statewide Variance indicates the following conditions regarding the reuse and management of ADL-impacted soil as fill material for construction and maintenance operations. If ADL soil meets the Variance criteria but is not intended to be reused within Caltrans right-of-way, then the excavated soil must be disposed of as a California hazardous waste (Caltrans Type Z-2). A copy of the DTSC Variance is presented in Appendix A.

Caltrans Type Y-1

ADL soil exhibiting a total lead concentration less than or equal to 1,411 mg/kg, a soluble lead concentration (based on a modified WET using deionized water as the extractant [DI-WET]) less than or equal to 1.5 mg/l, and a pH value greater than or equal to 5.5 may be reused within the same Caltrans corridor and must be covered with at least one foot of non-hazardous soil.

Caltrans Type Y-2

ADL soil exhibiting a total lead concentration less than or equal to 1,411 mg/kg, a DI-WET soluble lead concentration less than or equal to 1.5 mg/l, and a pH value greater than 5 and less than 5.5 may be reused within the same Caltrans corridor and must be covered and protected from infiltration by a pavement structure.

ADL soil exhibiting a total lead concentration less than or equal to 1,411 mg/kg, a DI-WET soluble lead concentration greater than 1.5 mg/l and less than or equal to 150 mg/l, and a pH value greater than 5 may be reused within the same Caltrans corridor and must be covered and protected from infiltration by a pavement structure.

ADL soil exhibiting a total lead concentration greater than 1,411 mg/kg and less than or equal to 3,397 mg/kg, a DI-WET soluble lead concentration less than or equal to 150 mg/l, and a pH value greater than 5 may be reused within the same Caltrans corridor and must be covered and protected from infiltration by a pavement structure.

Caltrans Type Z-2

ADL soil exhibiting a total lead concentration greater than 3,397 mg/kg, a DI-WET soluble lead concentration greater than 150 mg/l, or a pH value less than or equal to 5 is not eligible for reuse under the Variance and must be disposed of as a California hazardous waste.

Caltrans Type Z-3

ADL soil exhibiting a TCLP soluble lead concentration greater than or equal to 5.0 mg/l is not eligible for reuse under the Variance and must be disposed of as a RCRA hazardous waste.

2.3 California Human Health Screening Levels

The California Environmental Protection Agency (Cal/EPA) has prepared technical reports entitled *Use of California Human Health Screening Levels (CHHSLs) in Evaluation of Contaminated Properties* (Cal/EPA, January 2005) and *Revised California Human Health Screening Levels for Lead* (Cal/EPA, September 2009), which present CHHSLs for soil, shallow soil gas, and indoor air to assist in evaluating sites impacted by releases of hazardous chemicals.

The CHHSLs are concentrations of 44 hazardous chemicals that Cal/EPA considers to be below thresholds of concern for risks to human health. The CHHSLs were developed by the Office of Environmental Health Hazard Assessment (OEHHA) on behalf of Cal/EPA. The thresholds of concern used to develop the CHHSLs are an excess lifetime cancer risk of one in a million and a hazard quotient or 1.0 for non-cancer effects. Under most circumstances, the presence of a chemical at concentrations below its respective CHHSL can be assumed to not pose a significant risk. The presence of a chemical at concentrations above a CHHSL does not indicate that adverse impacts to human health are occurring or will occur, but suggests that further evaluation is warranted (Cal/EPA, January 2005).

The following CHHSLs were used for comparison: Table 1 of the *California Human Health Screening Levels for Soil and Comparison to Other Potential Environmental Concerns* (Cal/EPA, January 2005), *Revised California Human Health Screening Levels for Beryllium* (Cal/EPA, March 2009), and *Revised California Human Health Screening Levels for Lead* (Cal/EPA, September 2009). The respective CHHSLs are listed at the end of Table 3 for comparative purposes. Copies of the referenced CHHSLs are in Appendix B.

3. SCOPE OF SERVICES

We performed the scope of services summarized below as requested by Caltrans.

3.1 Pre-field Activities

- Prepared a *Health and Safety Plan (HSP)* dated November 5, 2012, to provide guidelines on the use of personal protective equipment and the health and safety procedures to be implemented by Geocon personnel during field activities. The HSP specified the safety procedures for field work, summarized chemical hazard information, and identified site safety officers, emergency contacts, and the locations of emergency medical care facilities.
- Prepared a *Workplan* dated November 16, 2012, which described the requested scope of services and quality assurance/quality control (QA/QC) sampling and laboratory procedures.
- Retained the services of Advanced Technology Laboratories (ATL), a Caltrans-approved and California-certified analytical laboratory, to perform the chemical analyses of soil and equipment blank samples.

- Provided a minimum of 48-hours' notice to the subscribing utilities via Underground Service Alert (Ticket Number A23070662) prior to job site mobilization.

3.2 Soil Sampling

The soil investigation was performed on November 6 and 7, 2012. The investigation consisted of collecting 20 soil samples from five hand-auger borings (1190-115 through 1190-119). Soil samples were collected from each of the hand-auger borings located along the proposed SR-2 offramp relocation area at the following depth intervals: surface to 0.5 foot, 1.0 to 1.5 feet, 2.0 to 2.5 feet, and/or 4.5 to 5.0 feet. Refusal was encountered in boring 1190-116 at a depth of 4.0 feet; thus, a soil sample was collected from a depth interval of 3.5 to 4.0 feet. As specified in the TO, the borings locations were advanced at approximately 300-foot intervals, within the footprint of the proposed construction. The approximate boring locations are shown on Figure 2.

3.3 GPS Coordinates

The borings were located utilizing a global positioning system (GPS) receiver. Data was recorded in the field and downloaded in the office using surveying TerraSync™ or similar software, in State Plane 83 coordinates. Boring latitude and longitude coordinates in decimal degrees are provided in Table 1.

3.4 Laboratory Analyses

Laboratory analyses were performed by ATL. Copies of the laboratory report and chain-of-custody (COC) documentation are in Appendix C. The laboratory reports in Appendix C include results for soil samples that were collected for a Caltrans soundwall project that are presented under separate cover. Based on the Caltrans TO and direction from Caltrans, the samples were analyzed for the following:

- Twenty soil samples were analyzed for both total lead by EPA Test Method 6010B and WET soluble lead using EPA Test Method 7420 with citrate acid as the extractant.
- Thirteen soil samples with WET lead results greater than or equal to 5.0 mg/l were analyzed for soluble lead using the WET with de-ionized water as the extractant (DI-WET) by EPA Test Method 7420.
- Five soil samples were analyzed for TCLP lead using EPA Test Method 7420.
- One soil sample was analyzed for California Code of Regulations (CCR) Title 22 metals following EPA Test Methods 6010B (metals) and 7471 (mercury).
- Two soil samples were analyzed for pH using EPA Test Method 9045C.

Four equipment blank (EB) water samples were analyzed for total lead using EPA Test Method 6010B.

3.5 Report Preparation

This report was prepared to summarize the objectives, procedures, and results of the investigation activities requested by Caltrans.

4. INVESTIGATIVE METHODS

4.1 Soil Sampling

Soil samples were collected from the five borings using hand-auger sampling equipment. Samples that were analyzed for metals were collected from designated sample intervals, placed into new re-sealable plastic bags and homogenized in the field within the sample bag. Homogenized soil within the bag was then transferred into new 4-ounce laboratory-provided glass soil jars, capped, labeled with the sample date/time and a unique soil sample number, and placed in a chilled ice chest pending shipment to the analytical laboratory.

Caltrans assigned a unique ID number to this project (1190). This ID number was included in the database, figures, and in the boring soil sample names. Soil sample identification numbers were assigned (1190-115) based on the TO boring and sample naming convention. Soil sample numbers were designated by the boring number and the top of the 6-inch depth interval from which the sample was collected. For example, the soil sample designated 1190-116-0.0 was obtained from approximately 0 to 0.5 foot.

Quality Assurance/Quality Control (QA/QC) procedures conducted during field activities included sampling equipment decontamination prior to each boring, and use of new re-sealable plastic sample bags, laboratory supplied sample containers, and sample COC documentation. Soil sampling equipment was cleaned between each sample by washing the equipment with an Alconox™ solution followed by a double rinse with de-ionized water. Sampling activities were conducted under supervision of Geocon's field manager.

The hand-auger borings were backfilled with surface soil from the immediate vicinity of the boring locations. Decontamination water was discharged to the ground surface away from areas potentially associated with surface water bodies or storm drain inlets.

4.2 Groundwater Sampling

As requested in the TO, boring 1190-115 was advanced to a depth of 16-feet with a direct-push drilling rig to evaluate the potential presence of groundwater. Groundwater was not encountered in the boring.

4.3 Equipment Blank Sampling

Four equipment blank samples were collected to verify proper cleaning of the sampling equipment. The equipment blank samples were obtained by passing distilled water over the decontaminated sampling equipment into unpreserved laboratory-provided containers.

4.4 Deviations from Workplan

Geocon performed the scope of work as described in the Workplan dated November 16, 2012 with the following exceptions:

- Refusal was encountered in boring 1190-116 at a depth of 4.0 feet; thus, a soil sample was collected from a depth interval of 3.5 to 4.0 feet.
- Groundwater was not encountered in the one boring advanced to evaluate the presence of groundwater. Therefore, a groundwater sample was not collected.

5. FIELD OBSERVATIONS AND INVESTIGATIVE RESULTS

5.1 Soil Conditions

The soil conditions encountered in the hand-auger borings generally consisted of dark brown, slightly moist to moist, medium dense silty sand and gray-brown, moist, dense, fine to coarse sand with some gravel. Groundwater was not encountered in the soil borings.

5.2 Analytical Results

Soil analytical results are summarized in Tables 1 and 2. Results were J-Flagged between the Practical Quantitation Limit (PQL) and the calculated Method Detection Limit (MDL). Results that are J-Flagged are estimated values since it becomes difficult to accurately quantitate the analyte near the MDL. Copies of the laboratory report and COC documentation are in Appendix C. Analytical results are summarized below:

- **Total lead** was reported for the 20 soil samples at concentrations ranging from 6.5 to 3,700 mg/kg.
- **WET lead** was reported for the 20 samples analyzed at concentrations ranging from 0.48 J to 230 mg/l.
- **WET-DI lead** was reported for eight of the 13 samples analyzed at concentrations ranging from 0.28 J to 1.0 mg/l.
- **TCLP lead** was reported for each of the five samples analyzed at concentrations ranging from 1.4 to 7.2 mg/l.

- **Title 22 metals** beryllium, silver and thallium were not detected at concentrations above their respective MDLs in the only sample analyzed; antimony and selenium had “J” flagged concentrations. Concentrations of the Title 22 metals, with the exception of lead, were less than ten times their respective STLCs and therefore additional testing using the WET method was not required.
- **pH** was reported at 6.4 for the two samples analyzed.
- Total lead was reported for one of the four equipment blank samples (1190-EB-3) at 0.0031 J mg/l. The equipment blank results are in Table 1.

5.3 Data Validation

Geocon and ATL use QA/QC measures to minimize and control errors associated with field and laboratory methods. Field QA/QC measures consist of cleaning sampling equipment between each use with a detergent solution followed by tap and distilled/purified water rinses. Based on the equipment blank sample analytical results, it appears that the decontamination procedures were sufficient to minimize the potential for cross-contamination resulting from inadequate equipment decontamination.

Laboratory QA/QC measures include the use of matrix spikes, duplicates, and method blanks, in addition to calculation of percent recovery and relative percentage difference (RPD). A review of the laboratory QA/QC results indicates satisfactory data reporting, and the data are of sufficient quality for the purposes of this report.

6. DATA EVALUATION

6.1 Lead

Statistical methods were applied to the total lead data to evaluate: 1) the upper confidence limits (UCLs) of the arithmetic means of the total lead concentrations for each sampling depth; and 2) if an acceptable correlation between total and soluble lead concentrations exists that would allow the prediction of soluble lead concentrations based on calculated UCLs.

6.1.1 Calculating the UCLs for the Arithmetic Mean

The upper one-sided 90% and 95% UCLs of the arithmetic mean are defined as the values that, when calculated repeatedly for randomly drawn subsets of site data, equal or exceed the true mean 90% and 95% of the time, respectively. Statistical confidence limits are the classical tool for addressing uncertainties of a distribution mean. The UCLs of the arithmetic mean concentration are used as the mean concentrations because it is not possible to know the true mean due to the essentially infinite number of soil samples that could be collected from a site. The UCLs therefore account for uncertainties due to limited sampling data. As data become less limited at a site, uncertainties decrease, and the UCLs move closer to the true mean.

Non-parametric bootstrap techniques were used to calculate the UCLs. The bootstrap results are included in Appendix D. The calculated UCLs and statistical results are summarized in the following tables:

SAMPLE INTERVAL (feet)	90% TOTAL LEAD UCL (mg/kg)	95% TOTAL LEAD UCL (mg/kg)	TOTAL LEAD MEAN (mg/kg)	MINIMUM VALUE (mg/kg)	MAXIMUM VALUE (mg/kg)
0.0 to 0.5	2,677	2,906	1,976	530	3,700
1.0 to 1.5*	250	250	163	31	250
2.0 to 2.5	408.4	465.7	245.1	6.5	740
4.5 to 5.0**	180	180	77.9	9.6	180

* An insufficient number of distinct values for this interval to calculate UCLs; thus the highest total lead data was used for the UCLs.

** An insufficient number of samples were collected from this interval; thus the highest total lead data was used for the UCLs.

6.1.2 Correlation of Total and Soluble Lead

Total and corresponding WET soluble lead concentrations are bivariate data with a linear structure. This linear structure should allow for the prediction of WET soluble lead concentrations based on the UCLs calculated above in Section 6.1.1.

To estimate the degree of interrelation between total and corresponding WET soluble lead values (x and y , respectively), the *correlation coefficient* [r] is used. The correlation coefficient is a ratio that ranges from +1 to -1. A *correlation coefficient* of +1 indicates a perfect direct relationship between two variables; a *correlation coefficient* of -1 indicates that one variable changes inversely with relation to the other. Between the two extremes is a spectrum of less-than-perfect relationships, including zero, which indicates the lack of any sort of linear relationship at all.

WET Soluble Lead

The *correlation coefficient* for the 20 (x , y) data points (i.e., soil samples analyzed for both total lead [x] and WET soluble lead [y]) was 0.9860. A *correlation coefficient* greater than or equal to 0.8 is an acceptable indicator that a correlation exists. Consequently, an acceptable *correlation coefficient* was achieved for the lead data.

For the *correlation coefficient* that indicates a linear relationship between total and WET soluble lead concentrations, it is possible to compute the line of dependence or a best-fit line between the two variables. A least squares method was used to find the equation of a best-fit line (regression line) by forcing the y -intercept equal to zero since that is a known point. The equation of the regression line was determined to be $y = 0.0587(x)$, where x represents total lead concentrations and y represents predicted WET soluble lead concentrations. This equation was used to estimate the expected WET soluble lead concentrations for the UCLs calculated in Section 6.1.1. Regression analysis results and a scatter plot depicting the (x , y) data points along with the regression line are in Appendix D. The 90% and 95% UCL-predicted WET soluble lead concentrations for various excavation depths are presented in Section 7.0.

The 90% and 95% UCL-predicted WET soluble lead concentrations for each sampling interval are presented in Appendix D.

TCLP Soluble Lead

Regression analysis was performed for total lead and TCLP soluble lead data. The *correlation coefficient* for the five (x, y) data points (i.e., soil samples analyzed for both total lead and TCLP soluble lead) was 0.9097. A *correlation coefficient* greater than or equal to 0.8 is an acceptable indicator that a correlation exists. Consequently, an acceptable *correlation coefficient* was achieved for the total lead and TCLP soluble lead data.

For the *correlation coefficient* that indicates a linear relationship between total and TCLP soluble lead concentrations, it is possible to compute the line of dependence or a best-fit line between the two variables. A least squares method was used to find the equation of a best-fit line (regression line) by forcing the y-intercept equal to zero since that is a known point. The equation of the regression line was $y = 0.0018(x)$, where x represents the total lead concentration and y represents the predicted TCLP soluble lead concentration. This equation was used to estimate the expected TCLP soluble lead concentrations for the UCLs calculated in Section 6.1.1. Regression analysis results and a scatter plot depicting the (x, y) data points along with the regression line are in Appendix D. The UCL-predicted WET and TCLP soluble lead concentrations are presented in Section 6.0.

7. FINDINGS AND CONCLUSIONS

7.1 ADL Soil Waste Classification/Disposal

Hazardous waste classification based on the 90% UCL is considered sufficient to satisfy a good faith effort as discussed in SW-846. Risk assessment characterization is typically based on the 95% UCL in accordance with the Risk Assessment Guidance for Superfund (RAGS) Volume 1 Documentation for Exposure Assessment. Per Caltrans, 90% UCLs are to be used to evaluate onsite reuse, and 95% UCLs are to be used to evaluate offsite reuse or disposal. Excavation scenarios were evaluated based on the calculated total lead UCLs for each sample interval and weighted averages for various excavation depths. Weighted averages are calculated by using the respective total lead UCLs based on various excavation scenarios. For depth intervals where no sample was collected, the calculated total lead UCL for the sampling interval above is used as representative value. In addition, the reuse of excavated soil has been evaluated, as applicable, based on the DTSC requirements for the Statewide Variance.

Two of the five soil samples had TCLP soluble lead concentrations exceeding the RCRA hazardous waste threshold of 5.0 mg/l. The highest calculated total lead UCL is 2,906 mg/kg. A waste may have the potential of exceeding the RCRA threshold when the waste's representative total lead concentration is greater than or equal to 100 mg/kg (20 times the RCRA threshold) since TCLP soluble lead analysis uses

a 1:20 dilution ratio. Based on the TCLP regression analysis (i.e., soil samples analyzed for both total lead and TCLP soluble lead), soil excavated from the top 0.5 foot may require disposal as a RCRA hazardous waste since the highest calculated total lead UCL of 2,906 mg/kg would yield a TCLP soluble lead concentration of 5.2 mg/l, greater than the federal RCRA hazardous waste threshold of 5.0 mg/l. Thus, soil generated from the top 0.5 foot within this area may require disposal as a RCRA hazardous waste. The designated disposal facility may require additional testing to confirm waste classification.

The table below summarizes the excavation scenarios, the predicted WET soluble lead concentrations and the waste classification for excavated soil within this area as represented by borings 1190-115 through 1190-119 based on the calculated total lead UCLs and the relationship between total and WET soluble lead.

Excavation Depth	90% UCL		95% UCL		SOIL TYPE	
	Total Lead (mg/kg)	Predicted WET (mg/kg)	Total Lead (mg/kg)	Predicted WET (mg/kg)	Invoke Variance	Surplus Soil
0 to 0.5 foot	2,677.0	157.1	2,906.0	170.6	Type Z-3	Type Z-3
0.5 to 5.0 feet	599.9	35.2	657.2	38.6	Type Y-1	Type Z-2
0 to 1.5 feet	1,868.0	109.7	2,020.7	118.6	Type Y-2	Type Z-2
1.5 to 5.0 feet	353.1	20.7	394.1	23.1	Type Y-1	Type Z-2
0 to 2.5 feet	1,252.5	73.5	1,355.5	79.6	Type Y-1	Type Z-2
2.5 to 5.0 feet	362.7	21.3	408.6	24.0	Type Y-1	Type Z-2
0 to 5.0 feet	807.6	47.4	882.1	51.8	Type Y-1	Type Z-2

Soil excavated to a depth of 5.0 feet or shallower would be classified as a hazardous waste since the 90% UCL-predicted WET lead concentrations are greater than the STLC for lead of 5.0 mg/l. Soil excavated from the top 5.0 feet or shallower would not be classified as RCRA hazardous since the 90% UCL-predicted TCLP lead concentrations are less than the RCRA hazardous waste threshold of 5.0 mg/l. Based on the DI-WET soluble lead and pH results, the top 5.0 feet or shallower of soil may be reused onsite in accordance with the DTSC Variance (as Caltrans Type Y-1) by placing the lead-impacted soil under at least one foot of non-hazardous soil or a pavement structure maintained by Caltrans.

If excavated soil from the top 0.5 foot will not be reused onsite, then excavated soil from the top 0.5 foot would likely be disposed of as a RCRA hazardous waste since the 95% UCL-predicted TCLP lead concentration is greater than the RCRA hazardous waste threshold of 5.0 mg/l.

Based on the 95% UCL-predicted TCLP lead concentrations of less than 5.0 mg/l, soil excavated from the top 1.5 to 5.0 feet will not likely be disposed of as a RCRA hazardous waste. Thus, if excavated soil from the top 1.5 to 5.0 feet will not be reused onsite, then the excavated soil should be either (1) managed and disposed of as a California hazardous waste or (2) stockpiled and resampled to confirm waste classification in accordance with specific disposal facility acceptance criteria, if applicable.

7.2 Title 22 Metals

One soil sample was analyzed for Title 22 metals. With the exception of lead, the reported concentrations of Title 22 metals were less than their respective TTLCs and ten times their respective STLCs.

The Title 22 metals concentrations for the soil samples collected from the borings were compared with the CHHSLs and the published background levels typically present in California soils as presented in *Background Concentrations of Trace and Major Elements in California Soils* (Kearney Foundation of Soil Science, Division of Agriculture and Natural Resources, University of California, March 1996). Arsenic, cadmium and lead were the only metals reported at concentrations greater than the residential and/or industrial CHHSLs and/or published background levels. Arsenic was detected in the soil sample at 3.8 mg/kg, greater than the CHHSL for residential land use of 0.07 mg/kg and commercial/industrial land use of 0.24 mg/kg. Arsenic is a naturally occurring element; therefore, the reported concentrations were compared to regional background concentrations. The March 2008 Department of Toxic Substances Control (DTSC) publication *Determination of a Southern California Regional Background Arsenic Concentration in Soil* establishes a regional background for arsenic within Southern California including Los Angeles County using naturally occurring and anthropogenic concentrations of arsenic. The report finds that the upper-bound background concentration for arsenic within Los Angeles County is 12 mg/kg. The reported arsenic concentration is less than 12 mg/kg; therefore, the arsenic concentration reported for the soil sample is considered to be consistent with background concentrations of arsenic in Los Angeles County.

Cadmium was detected in the soil sample at 2.2 mg/kg, greater than the CHHSL for residential land use of 1.7 mg/kg; however, the cadmium concentration was less than the CHHSL for commercial/industrial land use of 7.5 mg/kg.

7.3 pH

Soil pH was reported for the two soil samples at 6.4.

7.4 Worker Protection

Per Caltrans' requirements, contractor(s) should prepare a project-specific Health and Safety Plan (HSP) to prevent or minimize worker exposure to lead-impacted soil. The HSP should include a Lead Compliance Plan outlining protocols for environmental and personnel monitoring, requirements for personal protective equipment, and other appropriate health and safety protocols and procedures for the handling of lead-impacted soil.

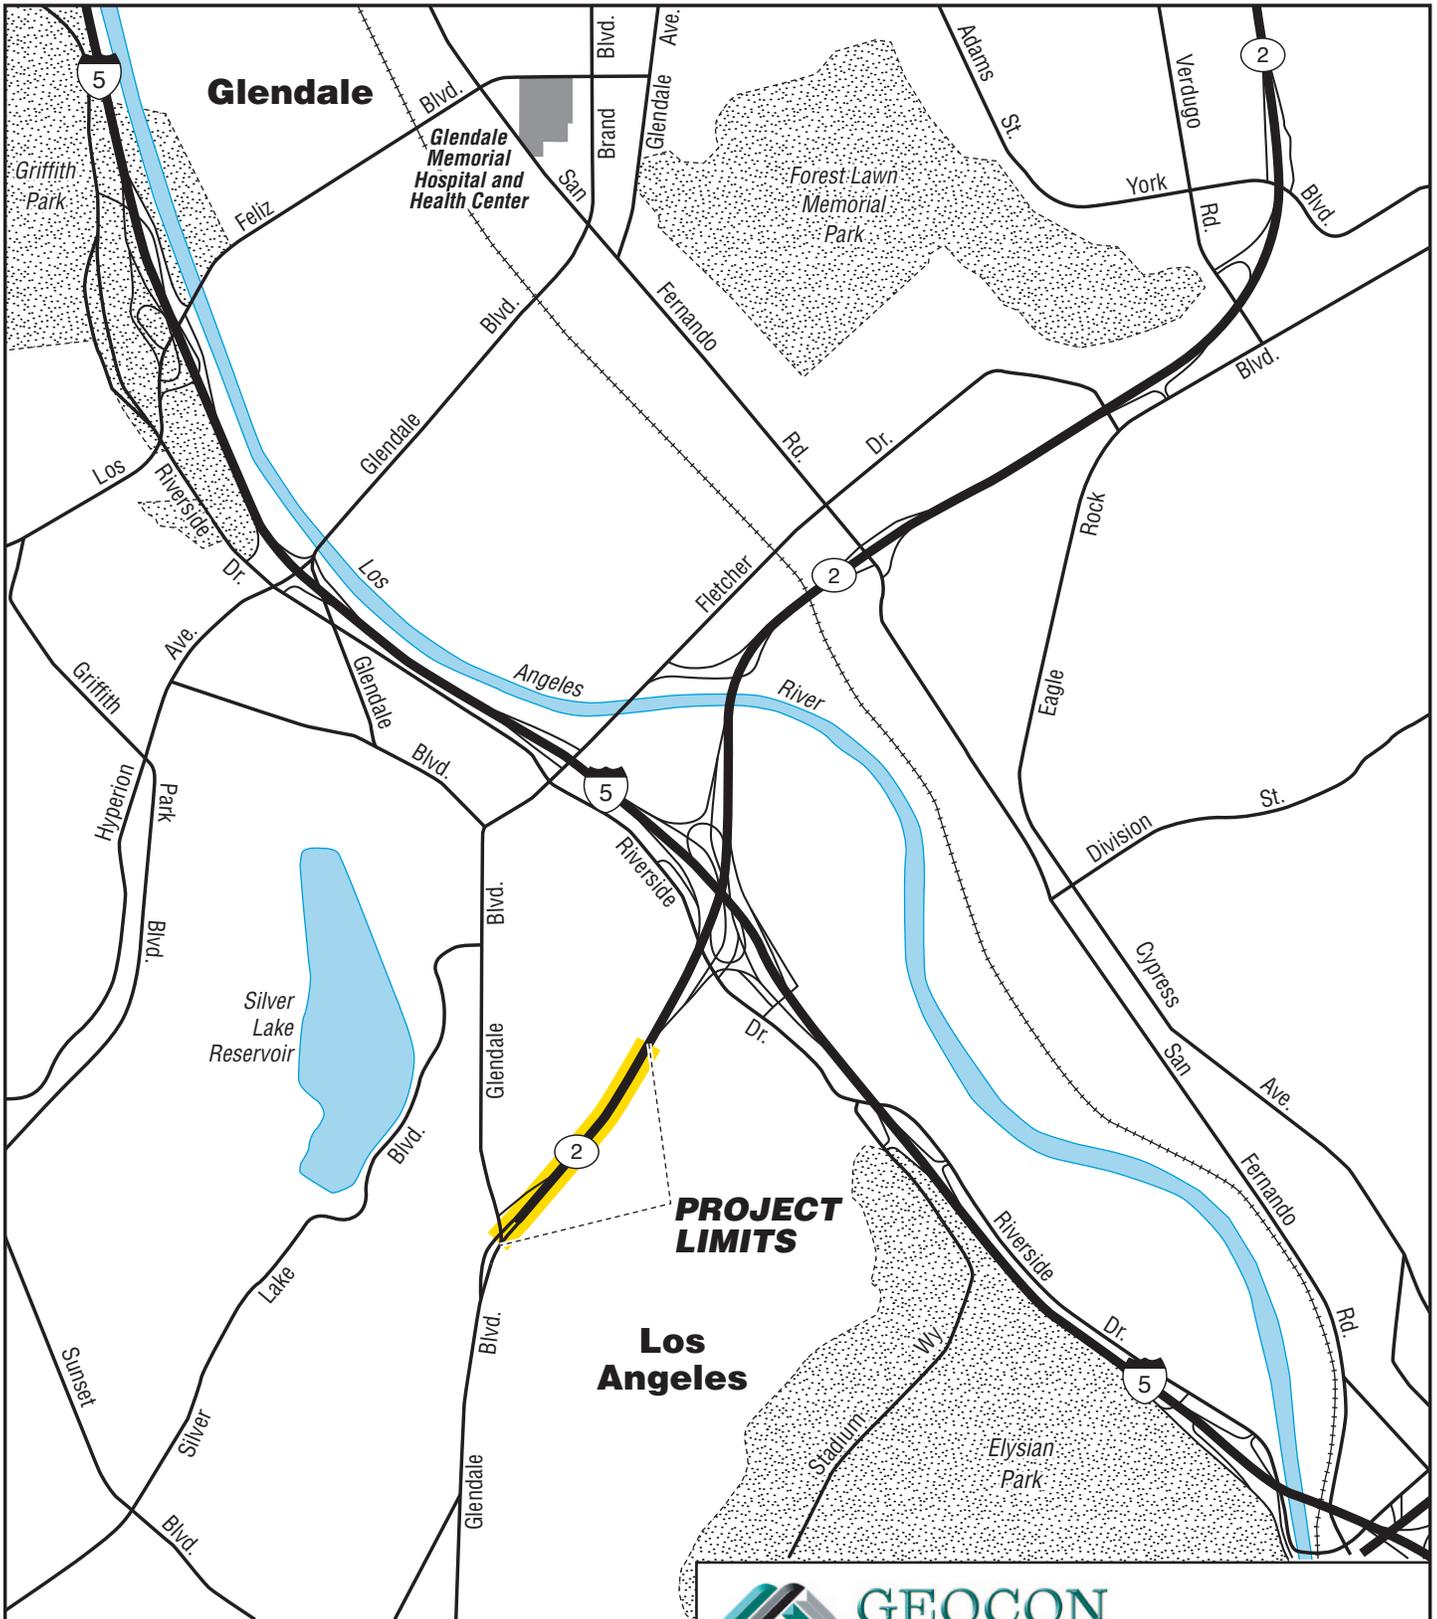

8. REPORT LIMITATIONS

This report has been prepared exclusively for Caltrans. The information obtained is only relevant as of the date of the latest site visit and will require an update to reflect additional information obtained.

The conclusions and recommendations presented herein are based on a limited number of samples collected from in-place soil location according to Caltrans-prescribed protocol. The purpose of these sampling and characterization activities was to reasonably predict the character of soil to be disturbed for planned construction activities within the described limits of the Caltrans right-of-way.

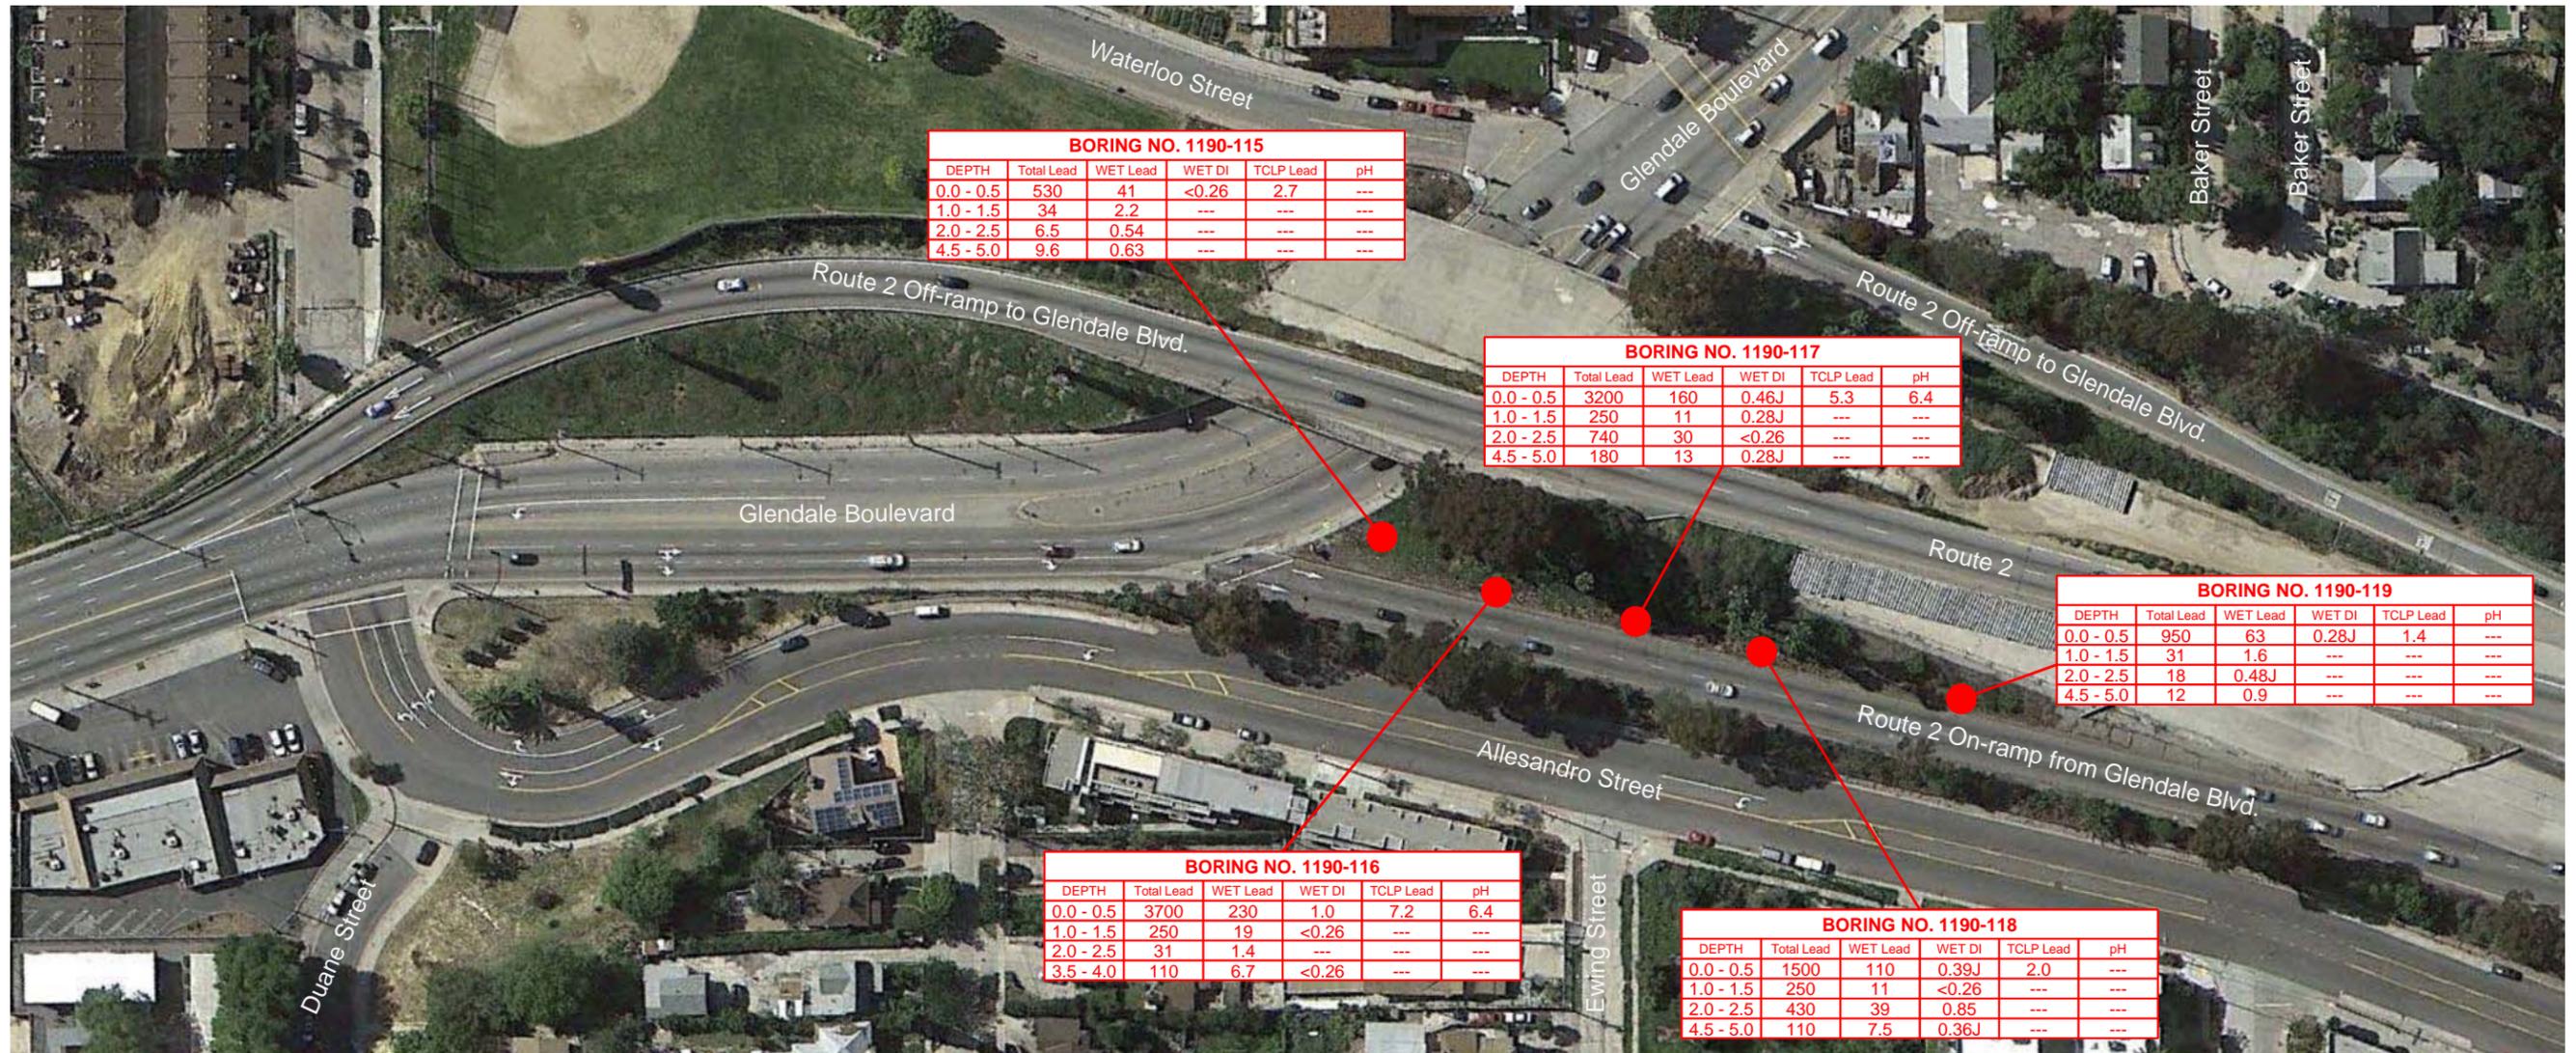

The Client should recognize that this report is not a comprehensive site characterization and should not be construed as such. The appropriate regulatory agency may require additional investigations. The findings and conclusions as presented in this report are predicated on the results of the limited soil sampling and laboratory analyses performed. In addition, the information obtained is not intended to address potential impacts related to sources other than those specified herein.

Therefore, the report should only be deemed conclusive with respect to the information obtained. No guarantee or warranty of the results of the report is implied within the intent of this report or any subsequent reports, correspondence, or consultation, either express or implied. Geocon strived to perform the services summarized herein in accordance with the local standard of care in the geographic region at the time the services were rendered.

VARIANCE

Applicant Names:

Variance No. V09HQSCD006

State of California
Department of Transportation
(Caltrans)
1120 N Street
Sacramento, California 95814

Effective Date: July 1, 2009

Expiration Date: July 1, 2014

Modification History:

Pursuant to California Health and Safety Code, Section 25143, the Department of Toxic Substances Control hereby issues the attached Variance consisting of 9 pages to the Department of Transportation.

A handwritten signature in cursive script that reads "Beverly Rikala".

Beverly Rikala
Team Leader, Operating Facilities Team
Department of Toxic Substances Control

Date: 6/30/09

VARIANCE

1. INTRODUCTION.

a) Pursuant to Health and Safety Code, section 25143, the California Department of Toxic Substances Control (DTSC) grants this variance to the applicant below for waste considered to be hazardous solely because of its lead concentrations and as further specified herein.

b) DTSC hereby grants this variance only from the requirements specified herein and only in accordance with all terms and conditions specified herein.

2. IDENTIFYING INFORMATION.

APPLICANT/OWNER/OPERATOR

State of California
Department of Transportation, (Caltrans)
All Districts

3. TYPE OF VARIANCE.

Generation, Manifest, Transportation, Storage and Disposal.

4. ISSUANCE AND EXPIRATION DATES.

DATE ISSUED: July 1, 2009 EXPIRATION DATE: July 1, 2014

5. APPLICABLE STATUTES AND REGULATIONS. The hazardous waste that is the subject of this variance is fully regulated under Health and Safety Code, section 25100, et seq. and California Code of Regulations, title 22, division 4.5 except as specifically identified in Section 8 of this variance.

6. DEFINITION. For purposes of this variance, "lead-contaminated soil(s)" shall mean soil that meets the criteria for hazardous waste but contains less than 3397 mg/kg total lead and is hazardous primarily because of aeriially-deposited lead contamination associated with exhaust emissions from the operation of motor vehicles.

7. FINDINGS/DETERMINATIONS. DTSC has determined that the variance applicant meets the requirements set forth in Health and Safety Code, section 25143 for a variance from specific regulatory requirements as outlined in Section 8 of this variance. The specific determinations and findings made by DTSC are as follows:

a) Caltrans intends to excavate, stockpile, transport, bury and cover large volumes of soil associated with highway construction projects. In the more urbanized highway corridors around the State this soil is contaminated with lead, primarily due to historic emissions from automobile exhausts. In situ sampling and laboratory testing has shown that some of the soil contains concentrations of lead in excess of State regulatory thresholds, and thus any generated waste from disturbance of the soil

would be regulated as hazardous waste. Such soil contains a Total Threshold Limit Concentration (TTLC) of 1000 milligrams per kilogram (mg/kg) or more lead and/or it meets or exceeds the Soluble Threshold Limit Concentration (STLC) for lead of 5 milligrams per liter (mg/l). A Human Health Risk Assessment prepared for this variance concludes that soil contaminated with elevated concentrations of lead can be managed in a way that presents no significant risk to human health.

b) The lead-contaminated soil will be placed only in Caltrans' right-of-way. Depending on concentration levels, the wastes will be covered with a minimum thickness of one (1) foot of non-hazardous soil or asphalt/concrete cover and will always be at least five (5) feet above the highest groundwater elevation. Caltrans will assure that proper health and safety procedures will be followed for workers, including any persons engaged in maintenance work in areas where the waste has been buried and covered.

c) DTSC finds and requires that the lead-contaminated soil excavated, stockpiled, transported, buried and covered pursuant to this variance is a non-RCRA hazardous waste, and that the waste management activity is insignificant as a potential hazard to human health and safety and the environment, when managed in accordance with the conditions, limitations and other requirements specified in this variance.

8. PROVISIONS WAIVED.

Provided Caltrans meets the terms and conditions of this variance, DTSC waives the hazardous waste management requirements of Health and Safety Code, Chapter 6.5 and California Code of Regulations, title 22 for the lead-contaminated soil that Caltrans reuses in projects that would require Caltrans to obtain a permit for a disposal facility and any other generator requirements that concern the transportation, manifesting, storage and land disposal of hazardous waste.

9. SPECIFIC CONDITIONS, LIMITATIONS AND OTHER REQUIREMENTS.

In order for the provisions discussed in section 8 to be waived, lead-contaminated soil must not exceed the contaminant concentrations discussed below and Caltrans management practices must meet all the following conditions:

a) Caltrans implementation of this variance shall comply with all applicable state laws and regulations for water quality control, water quality control plans, waste discharge requirements (including storm water permits), and others issued by the State Water Resources Control Board (SWRCB) and/or a California Regional Water Quality Control Board (RWQCB). Caltrans shall provide written notification to the appropriate RWQCB at least 30 days prior to advertisement for bids of projects that involve invocation of this variance, or as otherwise negotiated with the SWRCB or appropriate RWQCB.

b) The waivers in this variance shall only be applied to lead-contaminated soil that is not a RCRA hazardous waste and is hazardous primarily because of aerially-

deposited lead contamination associated with exhaust emissions from the operation of motor vehicles. The variance is not applicable to any other hazardous waste.

c) Soil containing 1.5 mg/l extractable lead or less (based on a modified waste extraction test using deionized water as the extractant) and 1411 mg/kg or less total lead may be used as fill provided that the lead-contaminated soil is placed a minimum of five (5) feet above the maximum historic water table elevation and covered with at least one (1) foot of nonhazardous soil that will be maintained by Caltrans to prevent future erosion.

d) Soil containing 150 mg/L extractable lead or less (based on a modified waste extraction test using deionized water as the extractant) and 3397 mg/kg or less total lead may be used as fill provided that the lead-contaminated soils are placed a minimum of five (5) feet above the maximum historic water table elevation and protected from infiltration by a pavement structure which will be maintained by Caltrans.

e) Lead-contaminated soil with a pH less than 5.5 but greater than 5.0 shall only be used as fill material under the paved portion of the roadway. Lead-contaminated soil with a pH at or less than 5.0 shall be managed as a hazardous waste.

f) For each project that has the potential to generate waste by disturbing lead-contaminated soil (as defined in 6), Caltrans shall conduct sampling and analysis to adequately characterize the soils containing aerially deposited lead in the areas of planned excavation along the project route. Such sampling and analysis shall include the Toxicity Characteristic Leaching Procedure (TCLP) as prescribed by the United States Environmental Protection Agency to determine whether concentrations of contaminants in soil exceed federal criteria for classification as a hazardous waste.

g) Lead-contaminated soil managed pursuant to this variance shall not be moved outside the designated corridor boundaries (see paragraph t) below. All lead-contaminated soil not buried and covered within the same Caltrans corridor where it originated is not eligible for management under this variance and shall be managed as a hazardous waste.

h) Lead-contaminated soil managed pursuant to this variance shall not be placed in areas where it would become in contact with groundwater or surface water (such as streams and rivers).

i) Lead-contaminated soil managed pursuant to this variance shall be buried and covered only in locations that are protected from erosion that may result from storm water run-on and run-off.

j) The lead-contaminated soil shall be buried and covered in a manner that will prevent accidental or deliberate breach of the asphalt, concrete, and/or cover soil.

k) The presence of lead-contaminated soil shall be incorporated into the projects' as-built drawings. The as-built drawings shall be annotated with the location, representative analytical data, and volume of lead-contaminated soil. The as-built drawings shall also state the depth of the cover. These as-built drawings shall be retained by Caltrans.

l) Caltrans shall ensure that no other hazardous wastes, other than the lead-contaminated hazardous waste soil, are placed in the burial areas.

m) Lead-contaminated soil shall not be buried within ten (10) feet of culverts or locations subject to frequent worker exposure.

n) Excavated lead-contaminated soil not placed into the designated area (fill area, roadbed area) by the end of the working day shall be stockpiled and covered with sheets of polyethylene or at least one foot of non-hazardous soil. The lead-contaminated soil, while stockpiled or under transport, shall be protected from contacting surface water and from being dislodged or transported by wind or storm water. The stockpile covers shall be inspected at least once a week and within 24 hours after rainstorms. If the lead-contaminated soil is stockpiled for more than 4 days from the time of excavation, Caltrans shall restrict public access to the stockpile by using barriers that meet the safety requirements of the construction zone. The lead-contaminated soil shall be stockpiled for no more than 90 days from the time the soil is first excavated. If the contaminated soil is stockpiled beyond the 90 day limit Caltrans shall:

1. notify DTSC in writing of the 90 day exceedance and expected date of removal;
2. perform weekly inspections of the stockpiled material to ensure that there is adequate protection from run-on, runoff, public access, and wind dispersion; and
3. notify DTSC on weekly basis of the stockpile status until the stockpile is removed.

The lead-contaminated soil shall be stockpiled for no more than 180 days from the time the soil is first excavated.

o) Caltrans shall ensure that all stockpiling of lead-contaminated soil remains within the project area of the specified corridor. Stockpiling of lead-contaminated soil within the specified corridor, but outside the project area, is prohibited.

p) Caltrans shall conduct confirmatory sampling of any stockpile area in areas not known or expected to contain lead-contaminated soil after removal of the lead-contaminated soil to ensure that contamination has not been left behind or has not migrated from the stockpiled material to the surrounding soils.

q) Caltrans shall stockpile lead-contaminated soil only on high ground (i.e. no sump areas or low points) so that stockpiled soil will not come in contact with surface

water run-on or run-off.

r) Caltrans shall not stockpile lead-contaminated soil in environmentally and ecologically sensitive areas.

s) Caltrans shall ensure that storm/rain run-off that has come into contact with stockpiled lead-contaminated soil will not flow to storm drains, inlets, or waters of the State.

t) Caltrans may dispose of the lead-contaminated soil only within the operating right-of-way of an existing highway, as defined in Streets and Highways Code, section 23. Caltrans may move lead-contaminated soil from one Caltrans project to another Caltrans project only if the lead-contaminated soil remains within the same designated corridor.

Caltrans shall record any movement of lead-contaminated soil by using a bill of lading. The bill of lading must contain: 1) the US DOT description including shipping name, hazard class and ID number; 2) handling codes; 3) quantity of material; 4) volume of material; 5) date of shipment; 6) origin and destination of shipment; and 7) any specific handling instructions. The bill of lading shall be referenced in and kept on file with the project's as-built drawings. The lead-contaminated soil must be kept covered during transportation.

u) For each specific corridor where this variance is to be implemented, all of the following information shall be submitted in writing to DTSC at least five (5) days before construction of any project begins:

1. plan drawing designating the boundaries of the corridor where lead-contaminated soils will be excavated, stockpiled, buried and covered;
2. a list of the Caltrans projects that the corridor encompasses;
3. a list of Caltrans contractors that will be conducting any phase of work on any project affected by this variance;
4. duration of corridor construction;
5. location where sampling and analytical data used to make lead concentration level determinations are kept (e.g. a particular Caltrans project file);
6. name and phone number (including area code) of project resident engineer and project manager;
7. location where Caltrans and contractor health and safety plan and records are kept;

8. location of project special provisions (including page or section number) for soil excavation, transportation, stockpile, burial and placement of cover material;

9. location of project drawings (including drawing page number) for soil excavation, burial and placement of cover in plan and cross section (for example, "The project plans are located at the resident engineer's office located at 5th and Main Streets, City of Fresno, See pages xxxxx of contract xxxx");

10. updated information if a Caltrans project within the corridor is added, changed or deleted; and

11. type of environmental document prepared for each project, date of adoption, document title, Clearing House number and where the document is available for review. A copy of the Caltrans Categorical Exemption, Categorical Exclusion Form, or if filed, the Notice of Exemption for any project shall be submitted to the DTSC Headquarters Project Manager.

v) Changes in location of lead-contaminated soil placement, quantities or protection measures (field changes) shall be noted in the resident engineer's project log within five (5) days of the field change.

w) Caltrans shall ensure that field changes are in compliance with the requirements of this variance.

x) Operational procedures described in the California Environmental Quality Act (CEQA) Special Initial Study shall be followed by Caltrans for activities conducted under this variance.

y) Caltrans shall implement appropriate health and safety procedures to protect its employees and the public, and to prevent or minimize exposure to potentially hazardous wastes. A project-specific health and safety plan must be prepared and implemented. The monitoring and exposure standards shall be based on construction standards for exposure to lead in California Code of Regulations, title 8, section 1532.1.

z) Caltrans shall provide a district Coordinator for this variance. This Coordinator will be the primary point of contact for information flowing to, or received from, DTSC regarding any matter or submission under this variance. Caltrans shall promptly notify DTSC of the name of Coordinator and any change in the Coordinator.

aa) Caltrans shall conduct regular inspections, consistent with Caltrans' Maintenance Division's current Pavement Inspection and Slope Inspection programs, of the locations where lead-contaminated soil has been buried and/or covered pursuant to this variance. If site inspection reveals deterioration of cover so that conditions in the variance are not met, Caltrans shall repair or replace the cover.

bb) Caltrans shall develop and implement a record keeping mechanisms to record and retain permanent records of all locations where lead-contaminated soil has been buried per this variance. The records shall be made available to DTSC.

cc) If areas subject to the terms of this variance are sold, relinquished or abandoned (including roadways), all future property owners shall be notified in writing in advance by Caltrans of the requirements of this variance, and Caltrans shall provide the owner with a copy of the variance. A copy of such a notice shall be sent to DTSC and contain the corridor location and project. Caltrans shall also disclose to DTSC and the new owner the location of areas where lead-contaminated soil has been buried. Future property owners shall be subject to the same requirements as Caltrans.

dd) For the purposes of informing the public about instances where the variance is implemented, Caltrans shall:

1. maintain current fact sheets at all Caltrans resident engineer offices and the Caltrans District office. Caltrans shall make the fact sheets available to anyone expressing an interest in variance-related work.
2. maintain a binder(s) containing copies of all reports submitted to DTSC at the District office. Caltrans shall ensure that the binders are readily accessible to the public.
3. carry out the following actions when it identifies additional projects:
 - (A) notify the public via a display advertisement in a newspaper of general circulation in that area.
 - (B) update and distribute the fact sheet to the mailing list and repository locations.

ee) Lead-contaminated soil may be buried only in areas where access is limited or where lead-contaminated soil is covered and contained by a pavement structure.

ff) Dust containing lead-contaminated soil must be controlled. Water or dust palliative may be applied to control dust. If visible dust migration occurs, all excavation, stockpiling and truck loading and burying must be stopped. The granting of this variance confers no relief on Caltrans from compliance with the laws, regulations and requirements enforced by any local air district or the California Air Resources Board.

gg) Sampling and analysis is required to show the lead-contaminated soil meets the variance criteria. All sampling and analysis must be conducted in accordance with the appropriate methods specified in U.S. EPA SW-846.

hh) DTSC retains the right to require Caltrans or any future owner to remove, and properly dispose of, lead-contaminated soil in the event DTSC determines it is necessary for protection of public health, safety or the environment.

ii) DTSC finds that some projects involving lead-contaminated soil are joint projects between Caltrans and other government entities. In these joint projects, Caltrans may not be the lead agency implementing the project although Caltrans is still involved if the project occurs on its right-of-way.

Caltrans may invoke this variance for joint projects where Caltrans and local government entity are involved provided that 1) the project is within the Caltrans Right-of-Way; 2) Caltrans reviews/ oversees all phases of the project including design, contracting, environmental assessment, construction, operation, and maintenance; and 3) Caltrans oversees the project to verify all variance conditions are complied with. Caltrans will be fully responsible for the variance notification and implementation in these joint projects.

jj) All correspondence shall be directed to the following office:

Hazardous Waste Permitting
Department of Toxic Substances Control
8800 Cal Center Drive
Sacramento, CA 95826

Attn: Caltrans Lead Variance Notification Unit

10. DISCLAIMER.

a) The issuance of this variance does not relieve Caltrans of the responsibility for compliance with Health and Safety Code, chapter 6.5, or the regulations adopted thereunder, and any other laws and regulations other than those specifically identified in Section 8 of this variance. Caltrans is subject to all terms and conditions herein. The granting of this variance confers no relief from compliance with any federal, State or local requirements other than those specifically provided herein.

b) The issuance of this variance does not release Caltrans from any liability associated with the handling of hazardous waste, except as specifically provided herein and subject to all terms and conditions of this variance.

11. VARIANCE MODIFICATION OR REVOCATION. This variance is subject to review at the discretion of DTSC and may be modified or revoked by DTSC upon change of ownership and at any other time pursuant to Health and Safety Code, section 25143.
12. CEQA DETERMINATION. DTSC adopted a Negative Declaration on June 30, 2009.

Table 1. California Human Health Screening Levels for Soil And Comparison To Other Potential Environmental Concerns

Chemical	¹ Soil Human Health Screening Levels (mg/kg of dry soil)		² Other Potential Environmental Concerns Posed By Contaminated Soil			
	Residential Land Use	Commercial/Industrial Land Use Only	³ Leaching	⁴ Ecotoxicity	⁵ Nuisance/Aesthetic Concerns	⁶ Other
Zinc	2.3E+04	1.0E+05	site specific	X	X	

Notes:

- Direct-exposure screening levels address human exposure to chemicals in soil via incidental ingestion, dermal absorption and inhalation of vapors and particulates emitted to outdoor air (refer to Appendix 1). Assumes impacted soil is situated at or near the ground surface or could be at some time in the future. Volatile chemicals not included at this time (refer to Section 2.5).
 "Residential Land Use" screening levels generally considered appropriate for other sensitive uses (e.g., day-care centers, hospitals, etc.). Commercial/Industrial properties should be evaluated using both residential and commercial/Industrial CHHSLs. A deed restriction that prohibits use of the property for sensitive purposes may be required at sites that are evaluated and/or remediated under a commercial/Industrial land use scenario only.
 Carcinogens: CHHSLs based on target cancer risk of 10⁻⁶. Cal/EPA cancer slope factors used when available.
 Noncarcinogens: CHHSLs based on target hazard quotient of 1.0.
 Calculation of cumulative risk may be required at sites where multiple contaminants with similar health effects are present (see Section 2.8).
 Residential and C/I soil CHHSLs for arsenic below background for most sites in California (0.07 mg/kg and 0.24 mg/kg, respectively - see Appendix 1). Use identified or anticipated background as screening level (see Section 2.7).
 Environmental concerns in addition to direct exposure that may need to be considered in evaluation of contaminated soil. Based on a comparison of soil CHHSLs to soil screening levels for noted concerns compiled by the San Francisco Bay Regional Water Quality Control Board (SFBRWQCB 2003). The need to address other environmental concerns must be evaluated separately in coordination with the lead regulatory agency (See Sections 1.4, 2.2 and Chapter 4).
 "X": Noted concern may outweigh direct-exposure risks at many sites and drive decisions for cleanup actions.
 "o": Potential concern but generally will be addressed if cleanup of contaminated soils to meet direct-exposure CHHSLs is carried out.
 "site specific": Potential concern, but evaluation as to whether this factor is a potential concern must be done on a site specific basis.
 Leaching of chemicals from soil and subsequent impacts to groundwater. Soil ESLs consider impacts to drinking water resources, re-emission of volatile chemicals from groundwater into overlying buildings and discharges of contaminated groundwater to surface water. Leaching of metals from soil should be evaluated on a site-specific basis, depending on the potential mobility of the metal species present. Laboratory-based leaching studies are generally preferred over model-derived screening levels.
 Toxicity to terrestrial flora and fauna. Need to consider ecotoxicity concerns generally determined on a site-by-site basis.
 Nuisance and gross contamination concerns address odors and aesthetic concerns as well as general resource degradation and presence of potentially mobile free product.
 Other pertinent environmental concerns and considerations as determined on a site-specific basis.
 Health risk to construction workers may outweigh risk to residents or commercial/Industrial workers for chemicals that are carcinogenic due to increased exposure to airborne dust particles and incidental ingestion of soil. Uptake of chemicals in edible fruits and vegetables from soil may need to be considered in some cases for noted chemicals.
 These metal salts are significantly (greater than 10-fold) more toxic than the values for the metals in general. If it is known that this chemical was used at the site, the screening number for this chemical should be used instead of the screening number for the metal and its compounds.
 Calculation of a screening number for the chemical has been postponed (pp) until the toxicity criterion currently being developed by OEHHA is published as a final document.
 This screening number is above the Total Threshold Limit Concentration for lead of 1000 mg/kg, as defined in Title 22, California Code of Regulations. It is also above the US EPA Region IX PRG of 800 mg/kg.

REVISED CALIFORNIA HUMAN HEALTH SCREENING LEVELS FOR BERYLLIUM

Revised California Human Health Screening Levels for Beryllium

Preface

In 2005, the California Office of Environmental Health Hazard Assessment (OEHHA) released a final document on the development of a list of soil screening numbers based on “protection of public health and safety” as required by Health and Safety Code Section 57008 (OEHHA, 2005). The screening numbers have no regulatory authority and are published solely as reference values that may be used by citizen groups, community organizations, property owners, developers, and local government officials to determine sites that would likely need no further action if a full risk assessment were conducted. How these soil screening levels should be applied is explained in “Use of California Human Health Screening Levels (CHHSLs) in Evaluation of Contaminated Properties,” (Cal/EPA, 2005).

Beryllium CHHSLs

For a CHHSL to be calculated, a chemical must have a toxicity criterion. A toxicity criterion mathematically relates a measure of exposure to a chemical to its toxic effect. For non-carcinogens it is generally the highest dose of the chemical not expected to cause a toxic effect. For a carcinogen it is the relationship between the risk of getting cancer caused by the chemical and the daily exposure to the chemical. In the OEHHA (2005) document, separate CHHSLs were developed for beryllium oxide, beryllium sulfate and all other forms of beryllium called “beryllium and compounds” because the three forms had different toxicity criteria. In 2005 the OEHHA Toxicity Criteria Database showed that all three were carcinogenic when inhaled. However, beryllium oxide and sulfate were considered carcinogenic when ingested, while “beryllium and compounds” was not. Residents and workers ingest far more soil at a site than the tiny amount that is inhaled after the soil is disturbed and becomes airborne dust. Therefore, the oral exposure generally drives the risk. This is why the CHHSLs for beryllium oxide and sulfate (considered carcinogenic when ingested) are so low compared to the CHHSL for beryllium and compounds (not considered carcinogenic when ingested)..

Beryllium Toxicity Criteria

The Toxicity Criteria Database is a Web site (www.oehha.ca.gov/risk/ChemicalDB/index.asp) that compiles the decisions of OEHHA’s ongoing evaluation of chemical toxicity. (The Integrated Risk Information System (IRIS) is the equivalent for the United States Environmental Protection Agency (USEPA) Web site). Toxicity criteria are based on a scientific study in which animals or humans have been exposed to several dose levels of the chemical and the incidence of adverse health effects has been measured. These scientific studies must meet certain criteria to be used.

Federal and California legislation in the mid 1980s required rapid criteria development of chemical toxicity at both levels of government. Some of these criteria were rescinded on reevaluation. The Beryllium Health Assessment document published in 1987 (USEPA, 1987) was the basis for oral cancer criteria for some forms of beryllium for both USEPA and

California. Shortly after the publication of the Beryllium Health Assessment document, both USEPA and OEHHA listed both oral and inhalation toxicity criteria for various forms of beryllium. USEPA reevaluated the 1987 Health Assessment document and scientific basis for calling beryllium oxide and beryllium sulfate carcinogenic by the oral route. The USEPA withdrew its oral potency factor on the April 3, 1998.

The USEPA toxicity criteria database (IRIS) has the following statement for beryllium and beryllium compounds, "The basis for not using the Schroeder and Mitchener rat study (1975a) is that the incidences of gross or malignant tumors in the control and beryllium-exposed groups were not significantly different." The Schroeder and Mitchener rat study (1975) was the previous basis for considering beryllium carcinogenic by the oral route. USEPA also stated, "The oral database is considered inadequate for the assessment of carcinogenicity." (IRIS, 1998). As a result, the IRIS Web site only lists a non-cancer Reference Dose (RfD) for oral exposure to beryllium.

Following the USEPA reevaluation, OEHHA reviewed the oral carcinogenicity for beryllium to determine a drinking water health goal (Public Health Goal; PHG). In the PHG document (OEHHA, 2003), OEHHA concurred with the USEPA decision and based the drinking water health goal for all beryllium compounds on a non-cancer effect. OEHHA states, "In this case the chemical is a known human carcinogen, based on exposures by the inhalation route, but oral cancer potency cannot be determined." (OEHHA, 2003).

The OEHHA PHG for beryllium is based on the same non-cancer scientific study used to determine the USEPA RfD, however, it is 10 times lower. This is because, after OEHHA identifies an appropriate study upon which to base the PHG, a No Observable Effect Level (NOAEL) is determined. OEHHA and USEPA identified the same NOAEL. The second step is to divide the NOAEL by an Uncertainty Factor (UF) that accounts for the uncertainty in extrapolating the NOAEL in animals to one for humans which was the same for OEHHA and USEPA. When OEHHA suspects that a chemical could cause cancer but lacks a credible study on which to base a cancer potency, the UF is increased 10-fold on the non-cancer criterion which was the case for beryllium. Therefore, the beryllium PHG is based on a toxicity criterion of 0.0002 mg/kg-d. The USEPA RfD, on which the 2005 beryllium and beryllium compounds is based, is 0.002 mg/kg-d.

Calculation of New Beryllium CHHSLs

Calculations are shown below for new CHHSL values for beryllium oxide, beryllium sulfate and "beryllium and compounds" and they will replace the values from the 2005 document. This is done in order to make the CHHSLs consistent with the most recent OEHHA toxicity evaluation. Two changes are required for consistency. First, the less health protective USEPA toxicity criterion of 0.002 mg/kg-d used to compute the 2005 beryllium and beryllium compounds CHHSL will be replaced with the toxicity criterion used to compute the OEHHA PHG. Second, none of the toxicity criteria used will be based on an oral cancer potency value.

Cancer Calculations

The OEHHA inhalation cancer slope factor for beryllium sulfate is $3000 \text{ (mg/kg-d)}^{-1}$. For all other beryllium compounds including beryllium oxide, the inhalation slope factor is $8.4 \text{ (mg/kg-d)}^{-1}$. The equations used to compute a CHHSL when an inhalation slope, but not an oral slope factor, is available is:

Residential CHHSL based on inhalation of cancer-causing dust

$$\text{CHHSL}_{\text{res}} = \frac{\text{TR} \times \text{AT} \times \text{PEF}}{\text{CSF}_i \times \text{EF}_r \times \left(\left(\frac{\text{IR}_a \times (\text{ED}_r - \text{ED}_c)}{\text{BW}_a} \right) + \left(\frac{\text{IR}_c \times \text{ED}_c}{\text{BW}_c} \right) \right)}$$

Where:

TR is the target risk - 10^{-6} (one in a million)

AT is 70 year lifetime in days called an averaging time 25550 days

PEF is the particulate emission factor - $1.316 \times 10^9 \text{ m}^3 \text{ air/kg soil}$

CSFi is the cancer slope factor for inhalation - $3000 \text{ (mg/kg-d)}^{-1}$ beryllium sulfate and $8.4 \text{ (mg/kg-d)}^{-1}$ for all other forms of beryllium including beryllium oxide.

IRa is the inhalation rate of an adult - $20 \text{ m}^3/\text{d}$

IRc is the inhalation rate of a child - $10 \text{ m}^3/\text{d}$

EFr is the exposure frequency for a resident - 350 days per year

EDr is the total exposure duration of a resident - 30 years

EDc is the exposure duration of a resident as a child - 6 years

BWa is the body weight of an adult - 70 kg

BWc is the body weight of an adult - 15 kg

Solving this residential equation modeling inhaled dust with these parameters for beryllium sulfate gives a CHHSL of 2.9 mg/kg. For all other forms of beryllium including beryllium oxide the CHHSL based on inhaled dust is 1043 mg/kg. CHHSLs are rounded to two significant figures yielding 2.9 and 1000 mg/kg, respectively.

Commercial/Industrial CHHSL based on inhalation of cancer-causing dust

$$\text{CHHSL}_{\text{ind}} = \frac{\text{TR} \times \text{AT} \times \text{PEF}}{\frac{\text{CSF}_i \times \text{IR}_w \times \text{EF}_w \times \text{ED}_w}{\text{BW}_w}}$$

Where:

TR is the target risk - 10^{-6} (one in a million)

AT is 70 year lifetime in days called an averaging time - 25550 days

PEF is the particulate emission factor - $1.316 \times 10^9 \text{ m}^3 \text{ air/kg soil}$

CSFi is the cancer slope factor for inhalation - $3000 \text{ (mg/kg-d)}^{-1}$ beryllium sulfate and $8.4 \text{ (mg/kg-d)}^{-1}$ for all other forms of beryllium including beryllium oxide.

IRw is the inhalation rate of an worker - $20 \text{ m}^3/\text{d}$

EFw is the exposure frequency for a worker - 250 days per year

EDw is the total exposure duration of a worker - 25 years

BWw is the body weight of a worker - 70 kg

Solving this industrial equation modeling inhaled dust with these parameters for beryllium sulfate gives a CHHSL of 6.3 mg/kg. For all other forms of beryllium including beryllium oxide the CHHSL based on inhaled dust is 2242 mg/kg. CHHSLs are rounded to two significant figures yielding 6.3 and 2200 mg/kg, respectively.

Non Cancer Calculations

The OEHHA PHG drinking water criterion is based on a RfD that is 10-fold less than the one published by the USEPA. This value is 0.002 mg/kg-d. This value is used in the calculations below.

Residential CHHSL based on noncancer health effects to a child

$$\text{CHHSL}_{\text{res}} = \frac{\text{THQ} \times \text{BW}_c \times 365}{\text{EF}_r \times \left(\left(\frac{\text{IRSc}}{\text{RfD}_{\text{oral}} \times 10^6} \right) + \left(\frac{\text{AF}_c \times \text{SA}_c \times \text{ABS}}{\text{RfD}_{\text{oral}} \times 10^6} \right) + \left(\frac{\text{IRAc}}{\text{RfD}_{\text{inh}} \times \text{PEF}} \right) \right)}$$

Where:

THQ is the target hazard quotient – 1.0

PEF is the particulate emission factor - $1.316 \times 10^9 \text{ m}^3 \text{ air/kg soil}$

RfDoral is the OEHHA reference dose for oral exposure - 0.0002 mg/kg-d

RfDinh is the USEPA reference dose for inhalation exposure - 0.00000571 mg/kg-d

IRc is the inhalation rate of a child - $10 \text{ m}^3/\text{d}$

IRSc is the soil ingestion rate of a child 200 mg/d

EFr is the exposure frequency for a resident - 350 days per year

EDc is the exposure duration of a resident as a child - 6 years

BWc is the body weight of a child - 15 kg

AFc is the soil to skin adherence factor for a child- 0.2 mg/cm^2

SAc is the surface area of skin to which soil can stick for a child – $2800 \text{ cm}^2/\text{d}$

ABS is the percent of chemical that can be absorbed through the skin -1%

Solving this residential equation modeling ingestion, inhalation and dermal contact with these parameters gives a CHHSL of 16 mg/kg.

Commercial/Industrial CHHSL based on noncancer health effects to a worker

$$CHHSL_{ind} = \frac{THQ \times BW_w \times 365}{EF_w \times \left(\left(\frac{IRS_w}{RfD_{oral} \times 10^6} \right) + \left(\frac{AF_w \times SA_w \times ABS}{RfD_{oral} \times 10^6} \right) + \left(\frac{IRA_w}{RfD_{inh} \times PEF} \right) \right)}$$

Where:

THQ is the target hazard quotient - 1.0

PEF is the particulate emission factor - 1.316×10^9 m³ air/kg soil

RfDoral is the OEHHA reference dose for oral exposure - 0.0002 mg/kg-d

RfDinh is the USEPA reference dose for inhalation exposure - 0.00000571 mg/kg-d

IRw is the inhalation rate of a worker - 20 m³/d

IRSw is the soil ingestion rate of a worker 100 mg/d

EFw is the exposure frequency for a worker - 250 days per year

EDw is the exposure duration of a resident as a worker - 25 years

BWw is the body weight of an adult - 70 kg

AFw is the soil to skin adherence factor for a worker- 0.2 mg/cm²

SAw is the surface area of skin to which soil can stick for a worker - 3300 cm²/d

ABS is the percent of chemical that can be absorbed through the skin -1%

Solving this industrial equation modeling ingestion, inhalation and dermal contact with these parameters gives a CHHSL of 190 mg/kg.

Conclusion

Summary of 2005 CHHSLs for Beryllium (mg/kg soil)

Scenario	Residential		Commercial/Industrial	
	Cancer	Non-cancer	Cancer	Non-cancer
Beryllium and Compounds	1000	150	2200	1700
Beryllium Oxide	0.091^a	150	0.41	1700
Beryllium Sulfate	0.00021	150	0.00095	1700

^a The values in bold are the 2005 CHHSLs for each compound and scenario.

Summary of Recalculated CHHSLs for Beryllium (mg/kg soil)

Scenario	Residential		Commercial/Industrial	
	Cancer	Non-cancer	Cancer	Non-cancer
Beryllium and Compounds	1000	16	2200	190
Beryllium Oxide	1000	16	2200	190
Beryllium Sulfate	2.9	16	6.3	190

Because the inadvertent ingestion of soil drives these calculations, eliminating the oral cancer potencies for beryllium oxide and beryllium sulfate dramatically increases the CHHSLs based on carcinogenicity from those published previously. Likewise, decreasing the oral RfD by a factor of 10 reduced the new CHHSLs based on non-cancer effects for beryllium and beryllium compounds 10-fold.

Summary of Updated 2008 CHHSLs for Beryllium (mg/kg soil)

Scenario	Residential	Commercial/Industrial
Beryllium Sulfate	2.9	6.3
All Other Beryllium Compounds	16	190

The residential CHHSL for beryllium sulfate is 2.9 mg/kg and the industrial CHHSL is 6.3 mg/kg. For all other forms of beryllium (including beryllium oxide), the non-cancer residential value of 16 is lower than the cancer residential value of 1000. Therefore, the residential CHHSL is 16 mg/kg. For all other forms of beryllium (including beryllium oxide), the non-cancer commercial/industrial value of 190 is lower than the cancer commercial/industrial value of 2200 mg/kg. Therefore, the commercial/industrial CHHSL is 190 mg/kg.

Appendix

Reponses to Comments Received on the September 2008 Review Draft Report

Dr. Jean Rabovsky representing herself.

Dr. Rabovsky points out that the document is unclear. The table showing the candidate CHSSLs did not include values for non-cancer endpoints for beryllium sulfate or beryllium oxide. She was concerned that the Office of Environmental Health Hazard Assessment (OEHHA) did not consider non-cancer endpoints. The revised tables have all values to avoid confusion.

Mr. Lawrence Szuhay representing Brush Wellman, Inc.

Mr. Szuhay had two comments:

1. In 2003, OEHHA should not have adopted the Public Health Goal (PHG) with the additional 10-fold safety factor. He believes that this is “improper and unnecessarily conservative.”
2. OEHHA should not compute a CHHSL for beryllium based on a cancer endpoint for inhalation.

Mr. Szuhay provided extensive written material in support of his two comments. Unfortunately, the two comments do not pertain to the action taken. OEHHA did not reevaluate the basis of either the beryllium PHG or the inhalation slope factor for any forms of beryllium as part of the CHHSL development process. Both the PHG and inhalation slope factors underwent a public comment period culminating in the adoption of the existing criteria in earlier actions by OEHHA that were not part of the CHHSL development process.

OEHHA eliminated oral cancer potency values for beryllium oxide and beryllium sulfate based on the findings of the 2003 beryllium PHG. In addition, OEHHA choose to use the reference dose developed for the PHG in 2003 instead of the U.S. Environmental Protection Agency’s Integrated Risk Information System (IRIS) criterion.

Revised California Human Health Screening Level for Lead

Introduction

The California Office of Environmental Health Hazard Assessment (OEHHA) has recently developed a 1 µg/dL benchmark for source-specific incremental change in blood lead levels for protection of school children and fetuses (OEHHA, 2007). The publication of this value required a review of the residential Soil Screening Level for lead (CHHSL), which currently stands at 150 mg/kg and the commercial/industrial CHHSL, which currently stands at 3500 mg/kg (OEHHA, 2005 revision). Application of this Soil Screening Level is explained in “Use of California Human Health Screening Levels in Evaluation of Contaminated Properties” (Cal/EPA, 2005).

Methods

The essence of this task was to estimate a concentration in soil that would lead to an incremental increase in blood lead (Pb_B) of up to 1 µg/dL, in people exposed to that soil. For the residential CHHSL for lead we evaluated the exposure to a child resident. For the commercial/industrial CHHSL we evaluated the exposure to a pregnant adult worker.

Residential Child Scenario

The Department of Toxic Substances Control’s Leadsread model (DTSC, 2007) was used to estimate blood lead concentrations in children. The Leadsread model considers exposure to lead in soil by three pathways: ingestion, re-suspension and inhalation, and dermal contact. The Leadsread model was queried for the soil lead concentrations that would give rise to a 90th percentile estimate of increase in blood lead of 1 µg/dL using the “goal seek” function in Excel™. Model inputs and outputs for the Child Scenario are shown in Table 1.

Table 1: Leadsread Input Values

FACTOR	LEVEL	UNITS
Lead in Soil/Dust	77	µg/g
Soil ingestion	100	mg/day
Ingestion constant	0.16	(µg/dl)/(µg/day)
Oral bioavailability	0.44	unitless
Skin area	2900	cm ²
Soil adherence	200	µg/cm ²
Dermal uptake constant	0.0001	(µg/dl)/(µg/day)
Respirable dust	1.5	ug/m ³
Breathing rate	6.8	m ³ /day
Inhalation constant	0.192	(µg/dl)/(µg/day)
Exposure days per week	7	days/wk
Geometric Standard Deviation ¹	1.6	µg/dL
Background lead in air ²	0	µg/m ³
Lead in water ²	0	µg/L
Home-grown produce ³	0	percent
Resulting 90 th percentile increase in blood lead	1	µg/dL

¹ Based on blood lead levels in geographically limited populations of children (EPA, 2007)

² Because this soil screening level is based on a change in blood lead due to the exposure under evaluation, no background exposures are included.

³ As explained in (OEHHA, 2005) the food pathway is not used in calculating soil screening levels. These screening levels may not be appropriate for sites to be used for gardening or farming.

Occupational Adult Scenario

U.S. EPA's Adult Lead Model (ALM) (EPA, 2005) was used to estimate the blood lead concentration in a fetus of an adult worker exposed to lead-contaminated soil. The model was queried directly for the soil lead concentrations that would give rise to the 90th percentile estimate of change in blood lead of 1 µg/dL using the "goal seek" function in Excel[™]. Model inputs and outputs are shown in Table 2. Inputs that were changed from default values are in bold.

Table 2: ALM Input and Output Values for the Occupational Scenario

FACTOR	UNITS	VALUE
Fetal/maternal Pb _B ratio	--	0.9
Biokinetic Slope Factor	µg/dL per µg/day	0.4
Geometric standard deviation Pb _B (GSD)	--	1.8 ²
Baseline Pb _B	µg/dL	0.0 ³
Soil ingestion rate (including soil-derived indoor dust)	g/day	0.050
Absorption fraction	--	0.12
Exposure frequency	days/yr	250 ⁴
Averaging time	days/yr	365
Pb _B of adult worker, geometric mean	µg/dL	0.6 ¹
90th percentile Pb _B among fetuses of adult workers	µg/dL	1.0
Target Pb _B level of concern	µg/dL	1.0
Probability that fetal Pb _B > Pb _{Bt} , assuming lognormal distribution	percent	10 %
Soil lead concentration	µg/g or ppm	320 ¹

¹ Calculated value

² The default GSD in ALM (2.1) was changed to 1.8. EPA (2001) recommended a value of 1.8 for relatively homogeneous populations. The default GSD in ALM reflects variability in the population as a whole. This variability has many components, including variability in exposure concentration. The latter source of variability is reduced or eliminated in a population exposed to soil containing 320 ppm.

³ No baseline Pb_B is assumed, since the target change in blood lead is an incremental change due to the soil in question.

⁴ The value of 250 days per year is consistent with other CHHSLs.

Results

The Soil Screening Levels resulting from the analyses described above are shown in Table 3.

Table 3: Comparison of 2005 CHHSLs to Revised CHHSLs

Residential CHHSL* (mg/kg)		Commercial/Industrial CHHSL ¹ (mg/kg)	
2005	Revised	2005	Revised
150	80	3500	320

¹ Rounded to nearest multiple of 10.

Discussion

The previous CHHSLs for lead were calculated as the maximum soil concentration which, combined with an assumed background lead exposure from food, air, and water, would result in a total blood lead not to exceed 10 µg/dl. The proposed CHHSLs are calculated differently: they are calculated as the level in soil that could result in up to a 1 µg/dl increase in blood lead, irrespective of background exposures. Background exposures are not typically considered in other CHHSLs or other screening levels.

The proposed CHHSLs for lead consider two sources of uncertainty: the relationship between blood lead level and cognitive ability, and the relationship between lead levels in the environment and blood lead levels. The first source of uncertainty involves the fitting of a model to the blood lead and IQ data in the meta-analysis of Lanphear et al. (2005) that was used to determine the relationship between blood lead and IQ. To be conservative OEHHA (2007) used a 97.5% upper confidence limit on the slope of the IQ versus Pb_B curve.

The other source of uncertainty is the relationship between environmental lead levels and blood lead levels. Both Leadsread and the ALM account for this by predicting a distribution of blood lead values for any given set of environmental inputs. The percentiles of the Pb_B versus soil Pb curve reflect physiological and behavioral variability in individual responses to similar environmental concentrations. Although the previous CHHSL for lead was based on the 99th percentile of that distribution, the revised CHHSL is based on the 90th percentile of the distribution. The reason for this change is that the benchmark change in blood lead concentration is a health-protective estimate, based on risk to children, whereas the previous target blood lead level was based on a “level of concern” that did not incorporate recent scientific information and focused on individual - rather than population - risks.

The overall approach to accommodating the two sources of uncertainty can be summarized as follows: the CHHSLs represent concentrations in soil that have no more than a 2.5% probability of decreasing IQ by more than 1 point in a 90th percentile child or fetus.

Appendix

Response to comments

OEHHA received two comments on the draft CHHSL for lead. Both commentors suggested that the lead CHHSL should be applied only to anthropogenic lead, i.e. that background lead should not be included.

OEHHA response: In its response to comment #48 to the original 2005 CHHSL document, OEHHA stated “The health-based screening number for arsenic is intended for arsenic contamination resulting from human activity.” This could also be applied to lead and other elements. However, the final determination of background levels and how they will be accounted for in any site-specific decision is ultimately up to those making the site-specific decision.

Re: ATL Work Order Number : 1203892
Client Reference : Los Angeles Route 2, S9475-06-22

Enclosed are the results for sample(s) received on November 06, 2012 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

A handwritten signature in black ink, appearing to read "Eddie Rodriguez", with a small initial "ER" below it.

Eddie Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and its absence renders the report invalid. Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Conference and/or applicable state-specific certification programs. The report cannot be reproduced without written permission from the client and Advanced Technology Laboratories.

CASE NARRATIVE

Results were J-flagged. "J" is used to flag those results that are between the PQL (Practical Quantitation Limit) and the calculated MDL (Method Detection Limit). Results that are "J" flagged are estimated values since it becomes difficult to accurately quantitate the analyte near the MDL.

Certificate of Analysis

Geocon Consultants, Inc.

3303 N. San Fernando Blvd., Suite 100

Burbank, CA 91504

Project Number : Los Angeles Route 2, S9475-06-22

Report To : Mike Conkle

Reported : 11/20/2012

Notes and Definitions

- R RPD value outside acceptance criteria. Calculation is based on raw values.
- M1 Matrix spike recovery outside of acceptance limit. The analytical batch was validated by the laboratory control sample.
- J Analyte detected below the Practical Quantitation Limit but above or equal to the Method Detection Limit. Result is an estimated concentration.
- ND Analyte not detected at or above reporting limit
- PQL Practical Quantitation Limit
- MDL Method Detection Limit
- NR Not Reported
- RPD Relative Percent Difference
- CA1 CA-NELAP (CDPH)
- CA2 CA-ELAP (CDPH)
- OR1 OR-NELAP (OSPHL)
- TX1 TX-NELAP (TCEQ)

Notes:

(1) The reported MDL and PQL are based on prep ratio variation and analytical dilution.

Re: ATL Work Order Number : 1203892
Client Reference : Los Angeles Route 2, S9475-06-22

Enclosed are the results for sample(s) received on November 06, 2012 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

A handwritten signature in black ink, appearing to be "E. Rodriguez".

Eddie Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and its absence renders the report invalid. Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Conference and/or applicable state-specific certification programs. The report cannot be reproduced without written permission from the client and Advanced Technology Laboratories.

SUMMARY OF SAMPLES

Sample ID	Laboratory ID	Matrix	Date Sampled	Date Received
1190-102-0.0	1203892-05	Soil	11/06/12 9:48	11/06/12 15:19
1190-104-0.0	1203892-09	Soil	11/06/12 11:35	11/06/12 15:19
1190-104-1.0	1203892-10	Soil	11/06/12 11:37	11/06/12 15:19
1190-105-0.0	1203892-13	Soil	11/06/12 12:20	11/06/12 15:19
1190-105-3.5	1203892-16	Soil	11/06/12 12:41	11/06/12 15:19

CASE NARRATIVE

Results were J-flagged. "J" is used to flag those results that are between the PQL (Practical Quantitation Limit) and the calculated MDL (Method Detection Limit). Results that are "J" flagged are estimated values since it becomes difficult to accurately quantitate the analyte near the MDL.

Sample Receiving/General Comments

Sample amount used for TCLP analysis by EPA 1311 is less than the amount required by the method. The client was notified on 11/29/12.

Notes and Definitions

R	RPD value outside acceptance criteria. Calculation is based on raw values.
M1	Matrix spike recovery outside of acceptance limit. The analytical batch was validated by the laboratory control sample.
J	Analyte detected below the Practical Quantitation Limit but above or equal to the Method Detection Limit. Result is an estimated concentration.
ND	Analyte not detected at or above reporting limit
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
NR	Not Reported
RPD	Relative Percent Difference
CA1	CA-NELAP (CDPH)
CA2	CA-ELAP (CDPH)
OR1	OR-NELAP (OSPHL)
TX1	TX-NELAP (TCEQ)

Notes:

(1) The reported MDL and PQL are based on prep ratio variation and analytical dilution.

Hi Diane,

We would like to run the test indicated with an "X" on the attached table. These samples are for Geocon project number S9475-06-22. ATL work order nos. 1203892, 1203893, 1203922, and 1203954.

Let me know if you have questions.

Re: ATL Work Order Number : 1203893
Client Reference : Los Angeles Route 2, S9475-06-22

Enclosed are the results for sample(s) received on November 06, 2012 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

A handwritten signature in black ink, appearing to read "Eddie Rodriguez".

Eddie Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and its absence renders the report invalid. Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Conference and/or applicable state-specific certification programs. The report cannot be reproduced without written permission from the client and Advanced Technology Laboratories.

CASE NARRATIVE

Results were J-flagged. "J" is used to flag those results that are between the PQL (Practical Quantitation Limit) and the calculated MDL (Method Detection Limit). Results that are "J" flagged are estimated values since it becomes difficult to accurately quantitate the analyte near the MDL.

Notes and Definitions

- R RPD value outside acceptance criteria. Calculation is based on raw values.
- M1 Matrix spike recovery outside of acceptance limit. The analytical batch was validated by the laboratory control sample.
- J Analyte detected below the Practical Quantitation Limit but above or equal to the Method Detection Limit. Result is an estimated concentration.
- ND Analyte not detected at or above reporting limit
- PQL Practical Quantitation Limit
- MDL Method Detection Limit
- NR Not Reported
- RPD Relative Percent Difference
- CA1 CA-NELAP (CDPH)
- CA2 CA-ELAP (CDPH)
- OR1 OR-NELAP (OSPHL)
- TX1 TX-NELAP (TCEQ)

Notes:

(1) The reported MDL and PQL are based on prep ratio variation and analytical dilution.

Re: ATL Work Order Number : 1203893
Client Reference : Los Angeles Route 2, S9475-06-22

Enclosed are the results for sample(s) received on November 06, 2012 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

A handwritten signature in black ink, appearing to read 'E. Rodriguez', is written over a light gray rectangular background.

Eddie Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and its absence renders the report invalid. Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Conference and/or applicable state-specific certification programs. The report cannot be reproduced without written permission from the client and Advanced Technology Laboratories.

SUMMARY OF SAMPLES

Sample ID	Laboratory ID	Matrix	Date Sampled	Date Received
1190-115-0	1203893-01	Soil	11/06/12 11:50	11/06/12 15:19

CASE NARRATIVE

Results were J-flagged. "J" is used to flag those results that are between the PQL (Practical Quantitation Limit) and the calculated MDL (Method Detection Limit). Results that are "J" flagged are estimated values since it becomes difficult to accurately quantitate the analyte near the MDL.

Sample Receiving/General Comments

Sample amount used for TCLP analysis by EPA 1311 is less than the amount required by the method. The client was notified on 11/29/12.

Hi Diane,

We would like to run the test indicated with an "X" on the attached table. These samples are for Geocon project number S9475-06-22. ATL work order nos. 1203892, 1203893, 1203922, and 1203954.

Let me know if you have questions.

Re: ATL Work Order Number : 1203922
Client Reference : Los Angeles Route 2, S9475-06-22

Enclosed are the results for sample(s) received on November 07, 2012 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

A handwritten signature in black ink, appearing to read 'Eddie Rodriguez', with a small 'Er' monogram below it.

Eddie Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and its absence renders the report invalid. Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Conference and/or applicable state-specific certification programs. The report cannot be reproduced without written permission from the client and Advanced Technology Laboratories.

CASE NARRATIVE

Results were J-flagged. "J" is used to flag those results that are between the PQL (Practical Quantitation Limit) and the calculated MDL (Method Detection Limit). Results that are "J" flagged are estimated values since it becomes difficult to accurately quantitate the analyte near the MDL.

Notes and Definitions

R	RPD value outside acceptance criteria. Calculation is based on raw values.
M1	Matrix spike recovery outside of acceptance limit. The analytical batch was validated by the laboratory control sample.
J	Analyte detected below the Practical Quantitation Limit but above or equal to the Method Detection Limit. Result is an estimated concentration.
ND	Analyte not detected at or above reporting limit
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
NR	Not Reported
RPD	Relative Percent Difference
CA1	CA-NELAP (CDPH)
CA2	CA-ELAP (CDPH)
OR1	OR-NELAP (OSPHL)
TX1	TX-NELAP (TCEQ)

Notes:

(1) The reported MDL and PQL are based on prep ratio variation and analytical dilution.

Re: ATL Work Order Number : 1203922
Client Reference : Los Angeles Route 2, S9475-06-22

Enclosed are the results for sample(s) received on November 07, 2012 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

A handwritten signature in black ink, appearing to be "E. Rodriguez".

Eddie Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and its absence renders the report invalid. Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Conference and/or applicable state-specific certification programs. The report cannot be reproduced without written permission from the client and Advanced Technology Laboratories.

SUMMARY OF SAMPLES

Sample ID	Laboratory ID	Matrix	Date Sampled	Date Received
1190-116-0.0	1203922-01	Soil	11/07/12 8:42	11/07/12 14:06
1190-117-0.0	1203922-05	Soil	11/07/12 9:37	11/07/12 14:06
1190-118-0.0	1203922-09	Soil	11/07/12 10:31	11/07/12 14:06
1190-119-0.0	1203922-13	Soil	11/07/12 11:08	11/07/12 14:06

CASE NARRATIVE

Results were J-flagged. "J" is used to flag those results that are between the PQL (Practical Quantitation Limit) and the calculated MDL (Method Detection Limit). Results that are "J" flagged are estimated values since it becomes difficult to accurately quantitate the analyte near the MDL.

Sample Receiving/General Comments

Sample amount used for TCLP analysis by EPA 1311 is less than the amount required by the method. The client was notified on 11/29/12.

Notes and Definitions

R	RPD value outside acceptance criteria. Calculation is based on raw values.
M1	Matrix spike recovery outside of acceptance limit. The analytical batch was validated by the laboratory control sample.
J	Analyte detected below the Practical Quantitation Limit but above or equal to the Method Detection Limit. Result is an estimated concentration.
ND	Analyte not detected at or above reporting limit
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
NR	Not Reported
RPD	Relative Percent Difference
CA1	CA-NELAP (CDPH)
CA2	CA-ELAP (CDPH)
OR1	OR-NELAP (OSPHL)
TX1	TX-NELAP (TCEQ)

Notes:

(1) The reported MDL and PQL are based on prep ratio variation and analytical dilution.

Subject: FW: geocon project number S9475-06-22 - additional analysis
Attachments: S9475-06-22 ATL Add Analysis.xlsx

Hi Diane,

We would like to run the test indicated with an "X" on the attached table. These samples are for Geocon project number S9475-06-22. ATL work order nos. 1203892, 1203893, 1203922, and 1203954.

Let me know if you have questions.

Re: ATL Work Order Number : 1203954
Client Reference : Los Angeles Route 2, S9475-06-22

Enclosed are the results for sample(s) received on November 08, 2012 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

A handwritten signature in black ink, appearing to read "Eddie Rodriguez".

Eddie Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and its absence renders the report invalid. Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Conference and/or applicable state-specific certification programs. The report cannot be reproduced without written permission from the client and Advanced Technology Laboratories.

CASE NARRATIVE

Results were J-flagged. "J" is used to flag those results that are between the PQL (Practical Quantitation Limit) and the calculated MDL (Method Detection Limit). Results that are "J" flagged are estimated values since it becomes difficult to accurately quantitate the analyte near the MDL.

Notes and Definitions

R	RPD value outside acceptance criteria. Calculation is based on raw values.
M1	Matrix spike recovery outside of acceptance limit. The analytical batch was validated by the laboratory control sample.
J	Analyte detected below the Practical Quantitation Limit but above or equal to the Method Detection Limit. Result is an estimated concentration.
ND	Analyte not detected at or above reporting limit
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
NR	Not Reported
RPD	Relative Percent Difference
CA1	CA-NELAP (CDPH)
CA2	CA-ELAP (CDPH)
OR1	OR-NELAP (OSPHL)
TX1	TX-NELAP (TCEQ)

Notes:

(1) The reported MDL and PQL are based on prep ratio variation and analytical dilution.

Special Instructions/Comments:
 CT Contract 07A2729
 Run samples for total lead and STLC. STLC results greater than 5.0 mg/l will be analyze with the soluble lead test by WET using de-ionized water (DI-WET) as the extractant. Report MDLs and PQLs. Filter and preserve water samples at the Lab.

I hereby authorize ATL to perform the work indicated below:
 Project Mgr./Submitter: *Mike Conkle* Date: 11/8/12

Special Instructions/Comments:
CT Contract 07A2729
Run samples for total lead and STLC. STLC results greater than 5.0 mg/l will be analyze with the soluble lead test by WET using de-ionized water (DI-WET) as the extractant. Report MDLs and PQLs. Filter and preserve water samples at the Lab.

Re: ATL Work Order Number : 1203954
Client Reference : Los Angeles Route 2, S9475-06-22

Enclosed are the results for sample(s) received on November 08, 2012 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

A handwritten signature in black ink, appearing to read "Eddie Rodriguez", with a small "Er" monogram to the left.

Eddie Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and its absence renders the report invalid. Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Conference and/or applicable state-specific certification programs. The report cannot be reproduced without written permission from the client and Advanced Technology Laboratories.

CASE NARRATIVE

Results were J-flagged. "J" is used to flag those results that are between the PQL (Practical Quantitation Limit) and the calculated MDL (Method Detection Limit). Results that are "J" flagged are estimated values since it becomes difficult to accurately quantitate the analyte near the MDL.

Notes and Definitions

M1	Matrix spike recovery outside of acceptance limit. The analytical batch was validated by the laboratory control sample.
J	Analyte detected below the Practical Quantitation Limit but above or equal to the Method Detection Limit. Result is an estimated concentration.
ND	Analyte not detected at or above reporting limit
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
NR	Not Reported
RPD	Relative Percent Difference
CA1	CA-NELAP (CDPH)
CA2	CA-ELAP (CDPH)
OR1	OR-NELAP (OSPHL)
TX1	TX-NELAP (TCEQ)

Notes:

(1) The reported MDL and PQL are based on prep ratio variation and analytical dilution.

Hi Diane,

We would like to run the test indicated with an "X" on the attached table. These samples are for Geocon project number S9475-06-22. ATL work order nos. 1203892, 1203893, 1203922, and 1203954.

Let me know if you have questions.

Dear Mr. Nili:

In accordance with Caltrans Contract No. 07A2729 and Task Order No. 22 dated October 25, 2012, Geocon Consultants, Inc. has performed an aerially deposited lead site investigation along U.S. Route 2 from the Glendale Boulevard undercrossing (UC) to Rosebud Avenue UC in the City of Los Angeles, California. The accompanying report summarizes the services performed, including the advancement of hand-auger borings, soil sampling, global positioning system data acquisition, laboratory analyses, and data evaluation.

The contents of this report reflect the views of the author, who is responsible for the facts and accuracy of the data presented herein. The contents do not necessarily reflect the official views or policies of the State of California or the Federal Highway Administration. This report does not constitute a standard, specification, or regulation.

Please call us if you have questions.

Sincerely,

GEOCON CONSULTANTS, INC.

EXECUTIVE SUMMARY

Geocon Consultants, Inc. performed an aerially deposited lead (ADL) site investigation for soundwalls along U.S. Route 2 from the Glendale Boulevard undercrossing (UC) to Rosebud Avenue UC in the City of Los Angeles, California. The objective of the investigation was to evaluate soil at the project site for the potential presence of ADL and soil pH. The California Department of Transportation (Caltrans) will use the information from the investigation to determine soil reuse and disposal options and identify health and safety concerns during construction activities.

Lead

Soil samples collected from the surface and depths up to 5 feet were analyzed for total lead and soluble lead using the Waste Extraction Test (WET) method with citric acid as the extractant. Selected samples were further analyzed for soluble lead using a modified WET method with de-ionized water (DI-WET) as the extractant, soluble lead using the Toxicity Characteristic Leaching Procedure (TCLP), and/or pH.

Laboratory analytical results and statistical analysis using non-parametric bootstrap techniques to calculate the 90% and 95% upper confidence limits (UCLs) were used to evaluate soil reuse and disposal options. The reuse of excavated soil has been evaluated, as applicable, based on the Department of Toxic Substances Control (DTSC) requirements in the Statewide Variance.

Onsite reuse and offsite disposal of excavated soil were based upon comparison of the total lead 90% and 95% UCLs to the California Code of Regulations (CCR) Title 22 total threshold limit concentration (TTLC) of 1,000 milligrams per kilogram (mg/kg) and predicted WET results to the CCR Title 22 soluble threshold limit concentration (STLC) of 5.0 milligrams per liter (mg/l). Soil reuse and disposal options for the northbound and southbound soundwalls are summarized below.

Based on the TCLP soluble lead results, soil generated at the Site is not considered a RCRA hazardous waste.

Caltrans should notify the contractors performing the construction activities that elevated concentrations of lead are present in onsite soil and that appropriate health and safety measures should be taken to minimize the exposure of construction workers to lead.

Northbound Soundwalls (Borings 1190-101 through 1190-107)

Based upon the predicted WET lead concentrations, soil excavated to a depth of 5.0 feet or shallower would be classified as a hazardous waste since the 90% UCL-predicted WET lead concentrations are greater than the STLC for lead of 5.0 mg/l. Based on the DI-WET soluble lead and pH results, the top 5.0 feet or shallower of soil may be reused onsite in accordance with the DTSC Variance (as Caltrans Type

Y-1) by placing the lead-impacted soil under at least one foot of non-hazardous soil or a pavement structure maintained by Caltrans.

Southbound Soundwalls (Borings 1190-108 through 1190-114)

Based upon the predicted WET lead concentrations, if soil from the surface to 5.0 feet or shallower is excavated and managed as a whole the soil would be classified as a hazardous waste since the 90% UCL-predicted WET lead concentrations are greater than the STLC for lead of 5.0 mg/l. Based on the DI-WET soluble lead and pH results, the top 5.0 feet of soil may be reused onsite in accordance with the DTSC Variance (as Caltrans Type Y-1) by placing the lead-impacted soil under at least one foot of non-hazardous soil or a pavement structure maintained by Caltrans.

Alternatively, if soil from the surface to 1.0 foot is removed and managed separately, the upper 1.0 foot of soil would be classified as Caltrans Type Y-1 for onsite reuse in accordance with the DTSC Variance by placing the lead-impacted soil under at least one foot of non-hazardous soil or a pavement structure maintained by Caltrans.

Underlying soil from depths of 1.0 to 5.0 feet where excavated as a whole could be reused or disposed of as non-hazardous soil (Caltrans Type X) with respect to lead content.

Title 22 Metals

The four samples with the highest reported total lead concentrations were analyzed for CCR Title 22 metals. With the exception of lead, Title 22 metals were not reported at or above their respective TTLC or ten times their respective STLCs. The concentrations of metals reported in the soil samples were below their respective residential and/or industrial California Human Health Screening Levels except for arsenic and lead. The reported arsenic concentrations are consistent with published background levels in Los Angeles County.

pH

Soil pH was reported to range between 5.3 and 7.5.

Worker Protection

Per Caltrans' requirements, contractor(s) should prepare a project-specific Health and Safety Plan (HSP) to prevent or minimize worker exposure to lead-impacted. The HSP should include a Lead Compliance Plan, and outline protocols for environmental and personnel monitoring, requirements for personal protective equipment and other appropriate health and safety protocols and procedures for the handling of lead-impacted soil.

Groundwater

One boring was advanced to a depth of 16-feet with a direct-push drilling rig to evaluate the potential presence of groundwater. Groundwater was not encountered in the boring.

AERIALY DEPOSITED LEAD SITE INVESTIGATION REPORT - SOUNDWALLS

1. INTRODUCTION

Geocon Consultants, Inc. performed an aerially deposited lead (ADL) site investigation along U.S. State Route 2 (SR-2) from the Glendale Boulevard undercrossing (UC) to Rosebud Avenue UC in the City of Los Angeles, California. The project location is shown on the Vicinity Map, Figure 1. The site investigation was conducted under California Department of Transportation (Caltrans) Contract No. 07A2729, Task Order (TO) No. 22, and Expense Authorization 205521, dated October 25, 2012.

1.1 Project Description

Caltrans proposes to construct four soundwalls along northbound and southbound SR-2. The proposed improvements will involve soil excavation and other earthwork activities within the project site. It is our understanding that the soil excavated for construction will be reused onsite and any excess soil will be removed from the project site for disposal.

1.2 Investigation Objective

The objective of the investigation was to evaluate concentrations of ADL in soils that will potentially be disturbed during excavation for the proposed project improvements. Caltrans will use the information obtained from the investigation to determine soil reuse or disposal options and identify health and safety concerns during proposed construction activities.

2. BACKGROUND

2.1 Hazardous Waste Classification Criteria

Regulatory criteria to classify a waste as “California hazardous” for handling and disposal purposes are contained in the California Code of regulations (CCR), Title 22, Division 4.5, Chapter 11, Article 3, §66261.24. Criteria to classify a waste as “Resource, Conservation and Recovery Act (RCRA) hazardous” are contained in Chapter 40 of the Code of Federal Regulations (40 CFR), §261.

For waste containing metals, the waste is classified as “California hazardous” when: (1) the representative total metal content exceeds or equals the respective Total Threshold Limit Concentration (TTLIC); or (2) the representative soluble metal content exceeds or equals the respective Soluble Threshold Limit Concentration (STLC) based on the standard Waste Extraction Test (WET). A waste may have the potential of exceeding the STLC when the waste’s total metal content is greater than or equal to ten times the respective STLC value, since the WET uses a 1:10 dilution ratio. Hence, when a total metal is detected at a concentration greater than or equal to ten times the respective STLC, and

assuming that 100 percent of the total metals are soluble, soluble metal analysis is typically performed. A material is classified as “RCRA hazardous” when the representative soluble metal content exceeds or equals the Federal Regulatory Level based on the Toxicity Characteristic Leaching Procedure (TCLP). The TTLC value for lead is 1,000 milligrams per kilogram (mg/kg). The STLC and TCLP values for lead are both 5.0 milligrams per liter (mg/l).

The above regulatory criteria are based on toxicity. Wastes may also be classified as hazardous based on other criteria such as ignitability, corrosivity, and reactivity. For the purposes of ADL investigations, toxicity and corrosivity (e.g., chemical concentrations and soil pH values, respectively) are the primary factors considered for waste classification. Waste that is classified as either “California hazardous” or “RCRA hazardous” requires management as a hazardous waste and disposal at an appropriately permitted disposal facility.

The Department of Toxic Substances Control (DTSC) regulates and interprets hazardous waste laws in California. DTSC generally considers excavated or transported materials that exhibit “hazardous waste” characteristics to be a “waste” requiring proper management, treatment and disposal. Soil that contains lead above hazardous waste thresholds and is left in-place would not be necessarily classified by DTSC as a “waste.” The DTSC has provided site-specific determinations that “movement of wastes within an area of contamination does not constitute "land disposal" and, thus, does not trigger hazardous waste disposal requirements.” Therefore, lead-impacted soil that is scarified in-place, moisture-conditioned, and re-compacted during roadway improvement activities might not be considered a “waste.” DTSC should be consulted to confirm waste classification. It is noted that in addition to DTSC regulations, health and safety requirements and other local agency requirements may also apply to the handling and disposal of lead-impacted soil.

2.2 DTSC Variance

The DTSC issued a statewide Variance effective July 1, 2009, regarding the reuse of ADL-impacted soils within Caltrans right-of-way. Under the Variance, soil that is classified as a non-RCRA hazardous waste, based primarily on ADL content, may be suitable for reuse within Caltrans right-of-way. ADL soil that is classified as a RCRA hazardous waste is not eligible for reuse under the Variance and must be disposed of as a RCRA hazardous waste (Caltrans Type Z-3).

ADL soil reused under the Variance must always be at least 5.0 feet above the highest groundwater elevation and, depending on lead concentrations, must be covered with at least one foot of non-hazardous soil or a pavement structure. The ADL soil may not be placed in areas where it might contact groundwater or surface water (such as streams and rivers), and must be buried in locations that are protected from erosion that may result from storm water run-on and run-off.

Review of the statewide Variance indicates the following conditions regarding the reuse and management of ADL-impacted soil as fill material for construction and maintenance operations. If ADL soil meets the Variance criteria but is not intended to be reused within Caltrans right-of-way, then the excavated soil must be disposed of as a California hazardous waste (Caltrans Type Z2). A copy of the DTSC Variance is in Appendix A.

Caltrans Type Y-1

ADL soil exhibiting a total lead concentration less than or equal to 1,411 mg/kg, a soluble lead concentration (based on a modified WET using deionized water as the extractant [DI-WET]) less than or equal to 1.5 mg/l, and a pH value greater than or equal to 5.5 may be reused within the same Caltrans corridor and must be covered with at least one foot of non-hazardous soil.

Caltrans Type Y-2

ADL soil exhibiting a total lead concentration less than or equal to 1,411 mg/kg, a DI-WET soluble lead concentration less than or equal to 1.5 mg/l, and a pH value greater than 5 and less than 5.5 may be reused within the same Caltrans corridor and must be covered and protected from infiltration by a pavement structure.

ADL soil exhibiting a total lead concentration less than or equal to 1,411 mg/kg, a DI-WET soluble lead concentration greater than 1.5 mg/l and less than or equal to 150 mg/l, and a pH value greater than 5 may be reused within the same Caltrans corridor and must be covered and protected from infiltration by a pavement structure.

ADL soil exhibiting a total lead concentration greater than 1,411 mg/kg and less than or equal to 3,397 mg/kg, a DI-WET soluble lead concentration less than or equal to 150 mg/l, and a pH value greater than 5 may be reused within the same Caltrans corridor and must be covered and protected from infiltration by a pavement structure.

Caltrans Type Z-2

ADL soil exhibiting a total lead concentration greater than 3,397 mg/kg, a DI-WET soluble lead concentration greater than 150 mg/l, or a pH value less than or equal to 5 is not eligible for reuse under the Variance and must be disposed of as a California hazardous waste.

Caltrans Type Z-3

ADL soil exhibiting a TCLP soluble lead concentration greater than or equal to 5.0 mg/l is not eligible for reuse under the Variance and must be disposed of as a RCRA hazardous waste.

2.3 California Human Health Screening Levels

The California Environmental Protection Agency (Cal/EPA) has prepared technical reports entitled *Use of California Human Health Screening Levels (CHHSLs) in Evaluation of Contaminated Properties* (Cal/EPA, January 2005) and *Revised California Human Health Screening Levels for Lead* (Cal/EPA, September 2009), which present CHHSLs for soil, shallow soil gas, and indoor air to assist in evaluating sites impacted by releases of hazardous chemicals.

The CHHSLs are concentrations of 44 hazardous chemicals that Cal/EPA considers to be below thresholds of concern for risks to human health. The CHHSLs were developed by the Office of Environmental Health Hazard Assessment (OEHHA) on behalf of Cal/EPA. The thresholds of concern used to develop the CHHSLs are an excess lifetime cancer risk of one in a million and a hazard quotient or 1.0 for non-cancer effects. Under most circumstances, the presence of a chemical at concentrations below its respective CHHSL can be assumed to not pose a significant risk. The presence of a chemical at concentrations above a CHHSL does not indicate that adverse impacts to human health are occurring or will occur, but suggests that further evaluation is warranted (Cal/EPA, January 2005).

The following CHHSLs were used for comparison: Table 1 of the *California Human Health Screening Levels for Soil and Comparison to Other Potential Environmental Concerns* (Cal/EPA, January 2005), *Revised California Human Health Screening Levels for Beryllium* (Cal/EPA, March 2009), and *Revised California Human Health Screening Levels for Lead* (Cal/EPA, September 2009). The respective CHHSLs are listed at the end of Table 3 for comparative purposes. Copies of the referenced CHHSLs are in Appendix B.

3. SCOPE OF SERVICES

We performed the scope of services summarized below as requested by Caltrans.

3.1 Pre-field Activities

- Prepared a *Health and Safety Plan* (HSP) dated November 5, 2012, to provide guidelines on the use of personal protective equipment and the health and safety procedures to be implemented by Geocon personnel during field activities. The HSP specified the safety procedures for field work, summarized chemical hazard information, and identified site safety officers, emergency contacts, and the locations of emergency medical care facilities.
- Prepared a *Workplan* dated November 16, 2012, which described the requested scope of services and quality assurance/quality control (QA/QC) sampling and laboratory procedures.
- Retained the services of Advanced Technology Laboratories (ATL), a Caltrans-approved and California-certified analytical laboratory, to perform the chemical analyses of soil and equipment blank samples.

- Provided a minimum of 48-hours' notice to the subscribing utilities via Underground Service Alert (Ticket Number A23070662) prior to job site mobilization.

3.2 Soil Sampling

The soil investigation was performed on November 6 through 8, 2012. The investigation consisted of collecting 56 soil samples from 14 hand-auger borings (1190-101 through 1190-114). Soil samples were collected from each of the hand-auger borings located on northbound LA-2 at the following depth intervals: surface to 0.5 foot, 1.0 to 1.5 feet, 2.0 to 2.5 feet, and/or 4.5 to 5.0 feet. Refusal was encountered in several borings at depths between 3.5 and 4.5 feet; thus, soil samples were collected from depth intervals of 3.0 to 3.5 feet, 3.5 to 4.0 feet, and/or 4.0 to 4.5 feet. As specified in the TO, the borings locations were advanced at approximately 300-foot intervals, within the footprint of the proposed construction. The approximate boring locations are shown on Figures 2 through 4.

3.3 GPS Coordinates

The borings were located utilizing a global positioning system (GPS) receiver. Data was recorded in the field and downloaded in the office using surveying TerraSync™ or similar software, in State Plane 83 coordinates. Boring latitude and longitude coordinates in decimal degrees are provided in Table 1.

3.4 Laboratory Analyses

Laboratory analyses were performed by ATL. Copies of the laboratory report and chain-of-custody (COC) documentation are in Appendix C. The laboratory reports in Appendix C include results for soil samples that were collected for a separate Caltrans project and are discussed in a separate report. Based on the Caltrans TO and direction from Caltrans, the samples were analyzed for the following:

- Fifty-six soil samples were analyzed for both total lead by EPA Test Method 6010B and WET soluble lead using EPA Test Method 7420 with citrate acid as the extractant.
- Twenty-four soil samples with WET lead results greater than or equal to 5.0 mg/l were analyzed for soluble lead using the WET with de-ionized water as the extractant (DI-WET) by EPA Test Method 7420.
- Ten soil samples were analyzed for TCLP lead using EPA Test Method 7420.
- Four soil samples were analyzed for California Code of Regulations (CCR) Title 22 metals following EPA Test Methods 6010B (metals) and 7471 (mercury).
- Six soil samples were analyzed for pH using EPA Test Method 9045C.

Four equipment blank (EB) water samples were analyzed for total lead using EPA Test Method 6010B.

3.5 Report Preparation

This report was prepared to summarize the objectives, procedures, and results of the investigation activities requested by Caltrans.

4. INVESTIGATIVE METHODS

4.1 Soil Sampling

Soil samples were collected from the 14 borings using hand-auger sampling equipment. Samples that were analyzed for metals were collected from designated sample intervals, placed into new re-sealable plastic bags and homogenized in the field within the sample bag. Homogenized soil within the bag was then transferred into new 4-ounce laboratory-provided glass soil jars, capped, labeled with the sample date/time and a unique soil sample number, and placed in a chilled ice chest pending shipment to the analytical laboratory.

Caltrans assigned a unique ID number to this project (1190). This ID number was included in the database, figures, and in the boring soil sample names. Soil sample identification numbers were assigned (1190-101) based on the TO boring and sample naming convention. Soil sample numbers were designated by the boring number and the top of the 6-inch depth interval from which the sample was collected. For example, the soil sample designated 1190-101-0.0 was obtained from approximately 0 to 0.5 foot.

Quality Assurance/Quality Control (QA/QC) procedures conducted during field activities included sampling equipment decontamination prior to each boring, and use of new re-sealable plastic sample bags, laboratory supplied sample containers, and sample COC documentation. Soil sampling equipment was cleaned between each sample by washing the equipment with an Alconox™ solution followed by a double rinse with de-ionized water. Sampling activities were conducted under supervision of Geocon's field manager.

The hand-auger borings were backfilled with surface soil from the immediate vicinity of the boring locations. Decontamination water was discharged to the ground surface away from areas potentially associated with surface water bodies or storm drain inlets.

4.2 Groundwater Sampling

As requested in the TO, boring 1190-103 was advanced to a depth of 16-feet with a direct-push drilling rig to evaluate the potential presence of groundwater. Groundwater was not encountered in the boring.

4.3 Equipment Blank Sampling

Four equipment blank samples were collected to verify proper cleaning of the sampling equipment. The equipment blank samples were obtained by passing distilled water over the decontaminated sampling equipment into unpreserved laboratory-provided containers.

4.4 Deviations from Workplan

Geocon performed the scope of work as described in the Workplan dated November 16, 2012 with the following exceptions:

- Refusal was encountered in several borings at depths between 3.5 and 4.5 feet; thus, soil samples were collected from depth intervals of 3.0 to 3.5 feet, 3.5 to 4.0 feet, and/or 4.0 to 4.5 feet.
- Groundwater was not encountered in the one boring advanced to evaluate the presence of groundwater. Therefore, a groundwater sample was not collected.

5. FIELD OBSERVATIONS AND INVESTIGATIVE RESULTS

5.1 Soil Conditions

The soil conditions encountered in the hand-auger borings generally consisted of dark brown, slightly moist to moist, medium dense silty sand and gray-brown, moist, dense, fine to coarse sand with some gravel. Groundwater was not encountered in the soil borings.

5.2 Analytical Results

Soil analytical results are summarized in Tables 1 and 2. Results were J-Flagged between the Practical Quantitation Limit (PQL) and the calculated Method Detection Limit (MDL). Results that are J-Flagged are estimated values since it becomes difficult to accurately quantitate the analyte near the MDL. Copies of the laboratory report and COC documentation are in Appendix C. Analytical results are summarized below:

- **Total lead** was reported for the 56 soil samples at concentrations ranging from 5.5 to 570 mg/kg.
- **WET lead** was reported for the 56 samples analyzed at concentrations ranging from 0.30 J to 47 mg/l.
- **WET-DI lead** was only reported for one of the 24 samples analyzed at an estimated concentration of 0.44 J mg/l.
- **TCLP lead** was reported for each of the ten samples analyzed at concentrations ranging from 0.33 to 2.4 mg/l.

- **Title 22 metals** beryllium, selenium, silver and thallium were not detected at concentrations above their respective MDLs in the four samples analyzed; antimony, cadmium and molybdenum had “J” flagged concentrations. Concentrations of the Title 22 metals, with the exception of lead, were less than ten times their respective STLCs and therefore additional testing using the WET method was not required.
- **pH** was reported to range between 5.3 and 7.5 for the six samples analyzed.
- Total lead was reported for one of the four equipment blank samples (1190-EB-3) at 0.0031 J mg/l. The equipment blank results are in Table 1.

5.3 Data Validation

Geocon and ATL use QA/QC measures to minimize and control errors associated with field and laboratory methods. Field QA/QC measures consist of cleaning sampling equipment between each use with a detergent solution followed by tap and distilled/purified water rinses. Based on the equipment blank sample analytical results, it appears that the decontamination procedures were sufficient to minimize the potential for cross-contamination resulting from inadequate equipment decontamination.

Laboratory QA/QC measures include the use of matrix spikes, duplicates, and method blanks, in addition to calculation of percent recovery and relative percentage difference (RPD). A review of the laboratory QA/QC results indicates satisfactory data reporting, and the data are of sufficient quality for the purposes of this report.

6. DATA EVALUATION

6.1 Lead

The lead data for the project site were treated as two separate sample populations for statistical evaluation based on location of the following sampling groups:

Data Population	Soil Samples Collected from Borings	No. of Borings
NB Soundwalls	1190-101 through 1190-107	7
SB Soundwalls	1190-108 through 1190-114	7

Statistical methods were applied to the total lead data to evaluate: 1) the upper confidence limits (UCLs) of the arithmetic means of the total lead concentrations for each sampling depth; and 2) if an acceptable correlation between total and soluble lead concentrations exists that would allow the prediction of soluble lead concentrations based on calculated UCLs.

6.1.1 Calculating the UCLs for the Arithmetic Mean

The upper one-sided 90% and 95% UCLs of the arithmetic mean are defined as the values that, when calculated repeatedly for randomly drawn subsets of site data, equal or exceed the true mean 90% and 95% of the time, respectively. Statistical confidence limits are the classical tool for addressing uncertainties of a distribution mean. The UCLs of the arithmetic mean concentration are used as the mean concentrations because it is not possible to know the true mean due to the essentially infinite number of soil samples that could be collected from a site. The UCLs therefore account for uncertainties due to limited sampling data. As data become less limited at a site, uncertainties decrease, and the UCLs move closer to the true mean.

Non-parametric bootstrap techniques were used to calculate the UCLs. The bootstrap results are in Appendix D. The calculated UCLs and statistical results are summarized in the following tables:

**NB Soundwalls
(Borings 1190-101 through 1190-107)**

SAMPLE INTERVAL (feet)	90% TOTAL LEAD UCL (mg/kg)	95% TOTAL LEAD UCL (mg/kg)	TOTAL LEAD MEAN (mg/kg)	MINIMUM VALUE (mg/kg)	MAXIMUM VALUE (mg/kg)
0.0 to 0.5	321.8	348.0	229.6	18	570
1.0 to 1.5	204.0	223.7	136.8	4.3	380
2.0 to 2.5	101.1	110.5	71.6	13	150
3.0 to 5.0*	194.9	211.1	129.9	8.7	400

* Insufficient samples were collected from a depth interval of 4.5 to 5.0 feet; thus samples collected between depths of 3.0 and 4.5 feet where refusal was encountered were included to calculate UCLs.

**SB Soundwalls
(Borings 1190-108 through 1190-114)**

SAMPLE INTERVAL (feet)	90% TOTAL LEAD UCL (mg/kg)	95% TOTAL LEAD UCL (mg/kg)	TOTAL LEAD MEAN (mg/kg)	MINIMUM VALUE (mg/kg)	MAXIMUM VALUE (mg/kg)
0.0 to 0.5	224.5	239.3	167.7	42	350
1.0 to 1.5	147.2	156.2	115.4	11	220
2.0 to 2.5	26.6	28.8	19.3	6.2	50
4.5 to 5.0	41.3	44.0	31.3	5.5	60

6.1.2 Correlation of Total and Soluble Lead

Total and corresponding WET soluble lead concentrations are bivariate data with a linear structure. This linear structure should allow for the prediction of WET soluble lead concentrations based on the UCLs calculated above in Section 6.1.1.

To estimate the degree of interrelation between total and corresponding WET soluble lead values (x and y , respectively), the *correlation coefficient* [r] is used. The correlation coefficient is a ratio that ranges from +1 to -1. A *correlation coefficient* of +1 indicates a perfect direct relationship between two variables; a *correlation coefficient* of -1 indicates that one variable changes inversely with relation to the other. Between the two extremes is a spectrum of less-than-perfect relationships, including zero, which indicates the lack of any sort of linear relationship at all.

The *correlation coefficients* for the NB Soundwalls and SB Soundwalls (x , y) data points (i.e., soil samples analyzed for both total lead [x] and WET soluble lead [y]) were 0.9646 and 0.8931, respectively. A *correlation coefficient* greater than or equal to 0.8 is an acceptable indicator that a correlation exists. Consequently, an acceptable *correlation coefficient* was achieved for the lead data.

For the *correlation coefficient* that indicates a linear relationship between total and WET soluble lead concentrations, it is possible to compute the line of dependence or a best-fit line between the two variables. A least squares method was used to find the equation of a best-fit line (regression line) by forcing the y -intercept equal to zero since that is a known point. The equations of the regression lines were determined to be $y = 0.0733(x)$ for NB Soundwalls and $y = 0.0701(x)$ for SB Soundwalls, where x represents total lead concentrations and y represents predicted WET soluble lead concentrations. These equations were used to estimate the expected WET soluble lead concentrations for the UCLs calculated in Section 6.1.1. Regression analysis results and scatter plots depicting the (x , y) data points along with the regression lines are in Appendix D. The 90% and 95% UCL-predicted WET soluble lead concentrations for various excavation depths are presented in Section 7.0. The 90% and 95% UCL-predicted WET soluble lead concentrations for each sampling interval are in Appendix D.

7. FINDINGS AND CONCLUSIONS

7.1 ADL Soil Waste Classification/Disposal

Hazardous waste classification based on the 90% UCL is considered sufficient to satisfy a good faith effort as discussed in SW-846. Risk assessment characterization is typically based on the 95% UCL in accordance with the Risk Assessment Guidance for Superfund (RAGS) Volume 1 Documentation for Exposure Assessment. Per Caltrans, 90% UCLs are to be used to evaluate onsite reuse, and 95% UCLs are to be used to evaluate offsite reuse or disposal. Excavation scenarios were evaluated based on the calculated total lead UCLs for each sample interval and weighted averages for various excavation depths. Weighted averages are calculated by using the respective total lead UCLs based on various excavation scenarios. For depth intervals where no sample was collected, the calculated total lead UCL for the sampling interval above is used as representative value. In addition, the reuse of excavated soil has been evaluated, as applicable, based on the DTSC requirements in the Statewide Variance.

Based on the TCLP soluble lead results, soil generated at the project site will not require disposal as a RCRA hazardous waste.

7.1.1 NB Soundwalls (Borings 1190-101 through 1190-107)

The table below summarizes the excavation scenarios, the predicted WET soluble lead concentrations and the waste classification for excavated soil within this area as represented by borings 1190-101 through 1190-107 based on the calculated total lead UCLs and the relationship between total and WET soluble lead.

Excavation Depth	90% UCL		95% UCL		SOIL TYPE	
	Total Lead (mg/kg)	Predicted WET (mg/kg)	Total Lead (mg/kg)	Predicted WET (mg/kg)	Invoke Variance	Surplus Soil
0 to 0.5 foot	321.8	23.6	348.0	25.5	Type Y-1	Type Z-2
<i>0.5 to 5.0 feet</i>	<i>190.2</i>	<i>13.9</i>	<i>206.8</i>	<i>15.2</i>	<i>Type Y-1</i>	<i>Type Z-2</i>
0 to 1.5 feet	282.5	20.7	306.6	22.5	Type Y-1	Type Z-2
<i>1.5 to 5.0 feet</i>	<i>169.4</i>	<i>12.4</i>	<i>184.2</i>	<i>13.5</i>	<i>Type Y-1</i>	<i>Type Z-2</i>
0 to 2.5 feet	230.5	16.9	250.8	18.4	Type Y-1	Type Z-2
<i>2.5 to 5.0 feet</i>	<i>176.1</i>	<i>12.9</i>	<i>191.0</i>	<i>14.0</i>	<i>Type Y-1</i>	<i>Type Z-2</i>
0 to 5.0 feet	203.3	14.9	220.9	16.2	Type Y-1	Type Z-2

Based upon the predicted WET lead concentrations, soil excavated to a depth of 5.0 feet or shallower would be classified as a hazardous waste since the 90% UCL-predicted WET lead concentrations are greater than the STLC for lead of 5.0 mg/l. The top 5.0 feet of excavated soil is not considered a RCRA hazardous waste based on the TCLP lead results. Based on the DI-WET soluble lead and pH results, the top 5.0 feet or shallower of soil may be reused onsite in accordance with the DTSC Variance (as Caltrans

Type Y-1) by placing the lead-impacted soil under at least one foot of non-hazardous soil or a pavement structure maintained by Caltrans.

If excavated soil from the top 5.0 feet or shallower will not be reused onsite, then the excavated soil should be either (1) managed and disposed of as a California hazardous waste or (2) stockpiled and resampled to confirm waste classification in accordance with specific disposal facility acceptance criteria, if applicable.

7.1.2 SB Soundwalls (Borings 1190-108 through 1190-114)

The table below summarizes the excavation scenarios, the predicted WET soluble lead concentrations and the waste classification for excavated soil within this area as represented by borings 1190-108 through 1190-114 based on the calculated total lead UCLs and the relationship between total and WET soluble lead.

Excavation Depth	90% UCL		95% UCL		SOIL TYPE	
	Total Lead (mg/kg)	Predicted WET (mg/kg)	Total Lead (mg/kg)	Predicted WET (mg/kg)	Invoke Variance	Surplus Soil
0 to 0.5 foot	224.5	15.7	239.3	16.8	Type Y-1	Type Z-2
<i>0.5 to 5.0 feet</i>	<i>77.0</i>	<i>5.4</i>	<i>82.2</i>	<i>5.8</i>	<i>Type Y-1</i>	<i>Type Z-2</i>
0 to 1.0 foot	224.5	15.7	239.3	16.8	Type Y-1	Type Z-2
<i>1.0 to 5.0 feet</i>	<i>58.6</i>	<i>4.1</i>	<i>62.6</i>	<i>4.4</i>	<i>Type X</i>	<i>Type X</i>
0 to 1.5 feet	198.7	13.9	211.6	14.8	Type Y-1	Type Z-2
<i>1.5 to 5.0 feet</i>	<i>45.9</i>	<i>3.2</i>	<i>49.2</i>	<i>3.4</i>	<i>Type X</i>	<i>Type X</i>
0 to 2.5 feet	154.0	10.8	164.0	11.5	Type Y-1	Type Z-2
<i>2.5 to 5.0 feet</i>	<i>29.5</i>	<i>2.1</i>	<i>31.8</i>	<i>2.2</i>	<i>Type X</i>	<i>Type X</i>
0 to 5.0 feet	91.8	6.4	97.9	6.9	Type Y-1	Type Z-2

Based upon the predicted WET lead concentrations, if soil from the surface to 5.0 feet or shallower is excavated and managed as a whole the soil would be classified as a hazardous waste since the 90% UCL-predicted WET lead concentrations are greater than the STLC for lead of 5.0 mg/l. Based on the DI-WET soluble lead and pH results, the top 5.0 feet of soil may be reused onsite in accordance with the DTSC Variance (as Caltrans Type Y-1) by placing the lead-impacted soil under at least one foot of non-hazardous soil or a pavement structure maintained by Caltrans.

Alternatively, if soil from the surface to 1.0 foot is removed and managed separately, the upper 1.0 foot of soil would be classified as Caltrans Type Y-1 for onsite reuse in accordance with the DTSC Variance by placing the lead-impacted soil under at least one foot of non-hazardous soil or a pavement structure maintained by Caltrans. If excavated soil from the top 1.0 foot will not be reused onsite, then the excavated soil should be either (1) managed and disposed of as a California hazardous waste (as Caltrans Type Z-2) or (2) stockpiled and resampled to confirm waste classification in accordance with specific disposal facility acceptance criteria, if applicable.

Underlying soil from depths of 1.0 to 5.0 feet where excavated as a whole could be reused or disposed of as non-hazardous soil (Caltrans Type X) with respect to lead content.

7.2 Title 22 Metals

Four soil samples were analyzed for Title 22 metals. With the exception of lead, the reported concentrations of Title 22 metals were less than their respective TTLCs and/or ten times their respective STLCs.

The Title 22 metals concentrations for the soil samples collected from the borings were compared with the CHHSLs and the published background levels typically present in California soils as presented in *Background Concentrations of Trace and Major Elements in California Soils* (Kearney Foundation of Soil Science, Division of Agriculture and Natural Resources, University of California, March 1996). Arsenic and lead were the only metals reported at concentrations greater than the residential and/or industrial CHHSLs and/or published background levels. Arsenic was detected in the soil samples collected from the borings at concentrations ranging from 2.2 to 2.8 mg/kg, greater than the CHHSL for residential land use of 0.07 mg/kg and commercial/industrial land use of 0.24 mg/kg. Arsenic is a naturally occurring element; therefore, the reported concentrations were compared to regional background concentrations. The March 2008 Department of Toxic Substances Control (DTSC) publication *Determination of a Southern California Regional Background Arsenic Concentration in Soil* establishes a regional background for arsenic within Southern California including Los Angeles County using naturally occurring and anthropogenic concentrations of arsenic. The report finds that the upper-bound background concentration for arsenic within Los Angeles County is 12 mg/kg. The reported arsenic concentrations are less than 12 mg/kg; therefore, the arsenic concentrations reported for the soil samples are considered to be consistent with background concentrations of arsenic in Los Angeles County.

7.3 pH

Soil pH was reported to range between 5.3 and 7.5.

7.4 Worker Protection

Per Caltrans' requirements, contractor(s) should prepare a project-specific Health and Safety Plan (HSP) to prevent or minimize worker exposure to lead-impacted soil. The HSP should include a Lead Compliance Plan outlining protocols for environmental and personnel monitoring, requirements for personal protective equipment, and other appropriate health and safety protocols and procedures for the handling of lead-impacted soil.

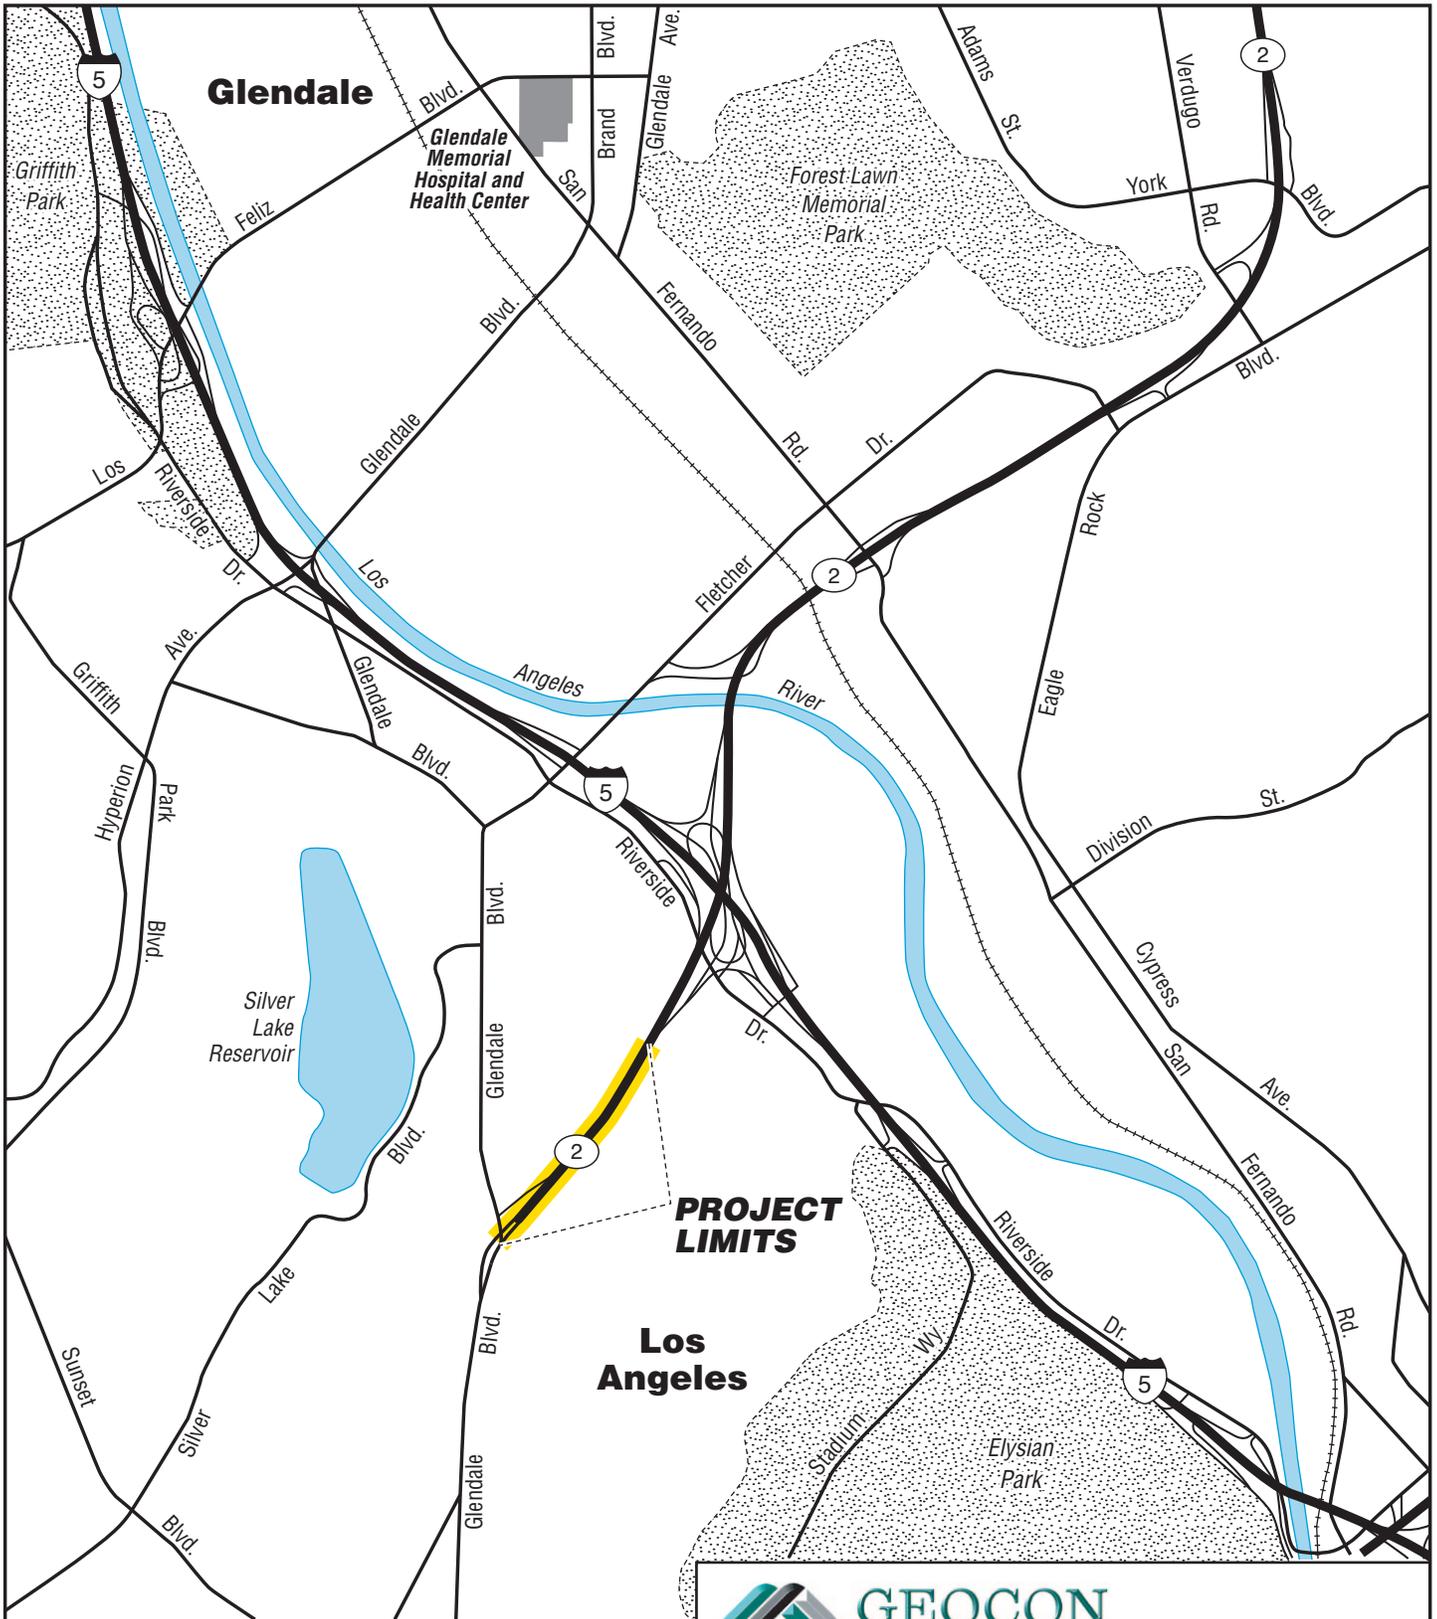

8. REPORT LIMITATIONS

This report has been prepared exclusively for Caltrans. The information obtained is only relevant as of the date of the latest site visit and will require an update to reflect additional information obtained.

The conclusions and recommendations presented herein are based on a limited number of samples collected from in-place soil location according to Caltrans-prescribed protocol. The purpose of these sampling and characterization activities was to reasonably predict the character of soil to be disturbed for planned construction activities within the described limits of the Caltrans right-of-way.

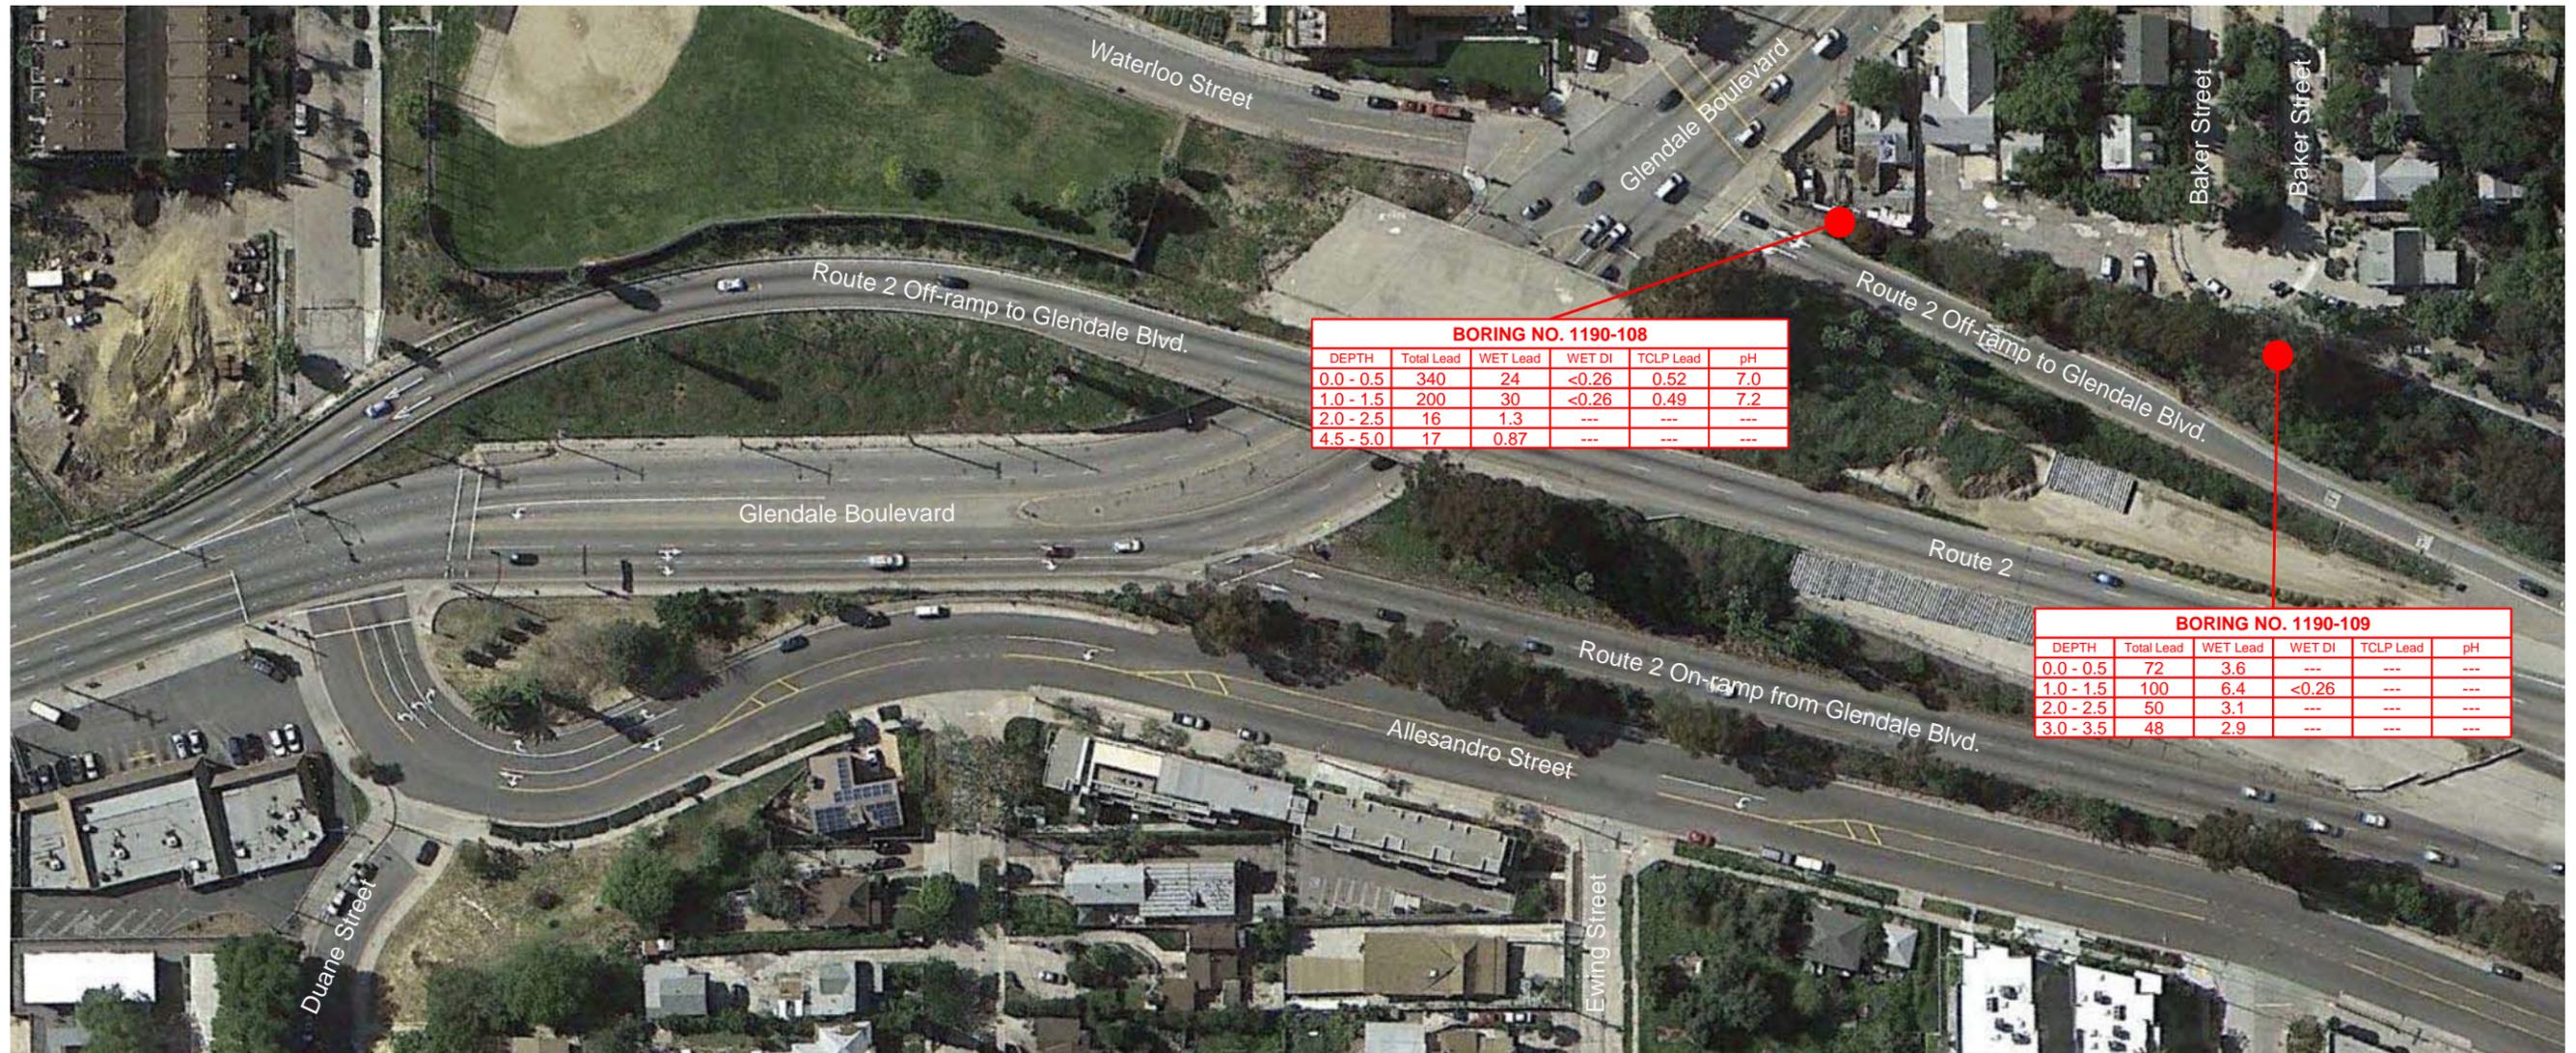

The Client should recognize that this report is not a comprehensive site characterization and should not be construed as such. The appropriate regulatory agency may require additional investigations. The findings and conclusions as presented in this report are predicated on the results of the limited soil sampling and laboratory analyses performed. In addition, the information obtained is not intended to address potential impacts related to sources other than those specified herein.

Therefore, the report should only be deemed conclusive with respect to the information obtained. No guarantee or warranty of the results of the report is implied within the intent of this report or any subsequent reports, correspondence, or consultation, either express or implied. Geocon strived to perform the services summarized herein in accordance with the local standard of care in the geographic region at the time the services were rendered.

VARIANCE

Applicant Names:

Variance No. V09HQSCD006

State of California
Department of Transportation
(Caltrans)
1120 N Street
Sacramento, California 95814

Effective Date: July 1, 2009

Expiration Date: July 1, 2014

Modification History:

Pursuant to California Health and Safety Code, Section 25143, the Department of Toxic Substances Control hereby issues the attached Variance consisting of 9 pages to the Department of Transportation.

A handwritten signature in cursive script that reads "Beverly Rikala".

Beverly Rikala
Team Leader, Operating Facilities Team
Department of Toxic Substances Control

Date: 6/30/09

VARIANCE

1. INTRODUCTION.

a) Pursuant to Health and Safety Code, section 25143, the California Department of Toxic Substances Control (DTSC) grants this variance to the applicant below for waste considered to be hazardous solely because of its lead concentrations and as further specified herein.

b) DTSC hereby grants this variance only from the requirements specified herein and only in accordance with all terms and conditions specified herein.

2. IDENTIFYING INFORMATION.

APPLICANT/OWNER/OPERATOR

State of California
Department of Transportation, (Caltrans)
All Districts

3. TYPE OF VARIANCE.

Generation, Manifest, Transportation, Storage and Disposal.

4. ISSUANCE AND EXPIRATION DATES.

DATE ISSUED: July 1, 2009 EXPIRATION DATE: July 1, 2014

5. APPLICABLE STATUTES AND REGULATIONS. The hazardous waste that is the subject of this variance is fully regulated under Health and Safety Code, section 25100, et seq. and California Code of Regulations, title 22, division 4.5 except as specifically identified in Section 8 of this variance.

6. DEFINITION. For purposes of this variance, "lead-contaminated soil(s)" shall mean soil that meets the criteria for hazardous waste but contains less than 3397 mg/kg total lead and is hazardous primarily because of aeriially-deposited lead contamination associated with exhaust emissions from the operation of motor vehicles.

7. FINDINGS/DETERMINATIONS. DTSC has determined that the variance applicant meets the requirements set forth in Health and Safety Code, section 25143 for a variance from specific regulatory requirements as outlined in Section 8 of this variance. The specific determinations and findings made by DTSC are as follows:

a) Caltrans intends to excavate, stockpile, transport, bury and cover large volumes of soil associated with highway construction projects. In the more urbanized highway corridors around the State this soil is contaminated with lead, primarily due to historic emissions from automobile exhausts. In situ sampling and laboratory testing has shown that some of the soil contains concentrations of lead in excess of State regulatory thresholds, and thus any generated waste from disturbance of the soil

would be regulated as hazardous waste. Such soil contains a Total Threshold Limit Concentration (TTL) of 1000 milligrams per kilogram (mg/kg) or more lead and/or it meets or exceeds the Soluble Threshold Limit Concentration (STLC) for lead of 5 milligrams per liter (mg/l). A Human Health Risk Assessment prepared for this variance concludes that soil contaminated with elevated concentrations of lead can be managed in a way that presents no significant risk to human health.

b) The lead-contaminated soil will be placed only in Caltrans' right-of-way. Depending on concentration levels, the wastes will be covered with a minimum thickness of one (1) foot of non-hazardous soil or asphalt/concrete cover and will always be at least five (5) feet above the highest groundwater elevation. Caltrans will assure that proper health and safety procedures will be followed for workers, including any persons engaged in maintenance work in areas where the waste has been buried and covered.

c) DTSC finds and requires that the lead-contaminated soil excavated, stockpiled, transported, buried and covered pursuant to this variance is a non-RCRA hazardous waste, and that the waste management activity is insignificant as a potential hazard to human health and safety and the environment, when managed in accordance with the conditions, limitations and other requirements specified in this variance.

8. PROVISIONS WAIVED.

Provided Caltrans meets the terms and conditions of this variance, DTSC waives the hazardous waste management requirements of Health and Safety Code, Chapter 6.5 and California Code of Regulations, title 22 for the lead-contaminated soil that Caltrans reuses in projects that would require Caltrans to obtain a permit for a disposal facility and any other generator requirements that concern the transportation, manifesting, storage and land disposal of hazardous waste.

9. SPECIFIC CONDITIONS, LIMITATIONS AND OTHER REQUIREMENTS.

In order for the provisions discussed in section 8 to be waived, lead-contaminated soil must not exceed the contaminant concentrations discussed below and Caltrans management practices must meet all the following conditions:

a) Caltrans implementation of this variance shall comply with all applicable state laws and regulations for water quality control, water quality control plans, waste discharge requirements (including storm water permits), and others issued by the State Water Resources Control Board (SWRCB) and/or a California Regional Water Quality Control Board (RWQCB). Caltrans shall provide written notification to the appropriate RWQCB at least 30 days prior to advertisement for bids of projects that involve invocation of this variance, or as otherwise negotiated with the SWRCB or appropriate RWQCB.

b) The waivers in this variance shall only be applied to lead-contaminated soil that is not a RCRA hazardous waste and is hazardous primarily because of aerially-

deposited lead contamination associated with exhaust emissions from the operation of motor vehicles. The variance is not applicable to any other hazardous waste.

c) Soil containing 1.5 mg/l extractable lead or less (based on a modified waste extraction test using deionized water as the extractant) and 1411 mg/kg or less total lead may be used as fill provided that the lead-contaminated soil is placed a minimum of five (5) feet above the maximum historic water table elevation and covered with at least one (1) foot of nonhazardous soil that will be maintained by Caltrans to prevent future erosion.

d) Soil containing 150 mg/L extractable lead or less (based on a modified waste extraction test using deionized water as the extractant) and 3397 mg/kg or less total lead may be used as fill provided that the lead-contaminated soils are placed a minimum of five (5) feet above the maximum historic water table elevation and protected from infiltration by a pavement structure which will be maintained by Caltrans.

e) Lead-contaminated soil with a pH less than 5.5 but greater than 5.0 shall only be used as fill material under the paved portion of the roadway. Lead-contaminated soil with a pH at or less than 5.0 shall be managed as a hazardous waste.

f) For each project that has the potential to generate waste by disturbing lead-contaminated soil (as defined in 6), Caltrans shall conduct sampling and analysis to adequately characterize the soils containing aerially deposited lead in the areas of planned excavation along the project route. Such sampling and analysis shall include the Toxicity Characteristic Leaching Procedure (TCLP) as prescribed by the United States Environmental Protection Agency to determine whether concentrations of contaminants in soil exceed federal criteria for classification as a hazardous waste.

g) Lead-contaminated soil managed pursuant to this variance shall not be moved outside the designated corridor boundaries (see paragraph t) below. All lead-contaminated soil not buried and covered within the same Caltrans corridor where it originated is not eligible for management under this variance and shall be managed as a hazardous waste.

h) Lead-contaminated soil managed pursuant to this variance shall not be placed in areas where it would become in contact with groundwater or surface water (such as streams and rivers).

i) Lead-contaminated soil managed pursuant to this variance shall be buried and covered only in locations that are protected from erosion that may result from storm water run-on and run-off.

j) The lead-contaminated soil shall be buried and covered in a manner that will prevent accidental or deliberate breach of the asphalt, concrete, and/or cover soil.

k) The presence of lead-contaminated soil shall be incorporated into the projects' as-built drawings. The as-built drawings shall be annotated with the location, representative analytical data, and volume of lead-contaminated soil. The as-built drawings shall also state the depth of the cover. These as-built drawings shall be retained by Caltrans.

l) Caltrans shall ensure that no other hazardous wastes, other than the lead-contaminated hazardous waste soil, are placed in the burial areas.

m) Lead-contaminated soil shall not be buried within ten (10) feet of culverts or locations subject to frequent worker exposure.

n) Excavated lead-contaminated soil not placed into the designated area (fill area, roadbed area) by the end of the working day shall be stockpiled and covered with sheets of polyethylene or at least one foot of non-hazardous soil. The lead-contaminated soil, while stockpiled or under transport, shall be protected from contacting surface water and from being dislodged or transported by wind or storm water. The stockpile covers shall be inspected at least once a week and within 24 hours after rainstorms. If the lead-contaminated soil is stockpiled for more than 4 days from the time of excavation, Caltrans shall restrict public access to the stockpile by using barriers that meet the safety requirements of the construction zone. The lead-contaminated soil shall be stockpiled for no more than 90 days from the time the soil is first excavated. If the contaminated soil is stockpiled beyond the 90 day limit Caltrans shall:

1. notify DTSC in writing of the 90 day exceedance and expected date of removal;
2. perform weekly inspections of the stockpiled material to ensure that there is adequate protection from run-on, runoff, public access, and wind dispersion; and
3. notify DTSC on weekly basis of the stockpile status until the stockpile is removed.

The lead-contaminated soil shall be stockpiled for no more than 180 days from the time the soil is first excavated.

o) Caltrans shall ensure that all stockpiling of lead-contaminated soil remains within the project area of the specified corridor. Stockpiling of lead-contaminated soil within the specified corridor, but outside the project area, is prohibited.

p) Caltrans shall conduct confirmatory sampling of any stockpile area in areas not known or expected to contain lead-contaminated soil after removal of the lead-contaminated soil to ensure that contamination has not been left behind or has not migrated from the stockpiled material to the surrounding soils.

q) Caltrans shall stockpile lead-contaminated soil only on high ground (i.e. no sump areas or low points) so that stockpiled soil will not come in contact with surface

water run-on or run-off.

r) Caltrans shall not stockpile lead-contaminated soil in environmentally and ecologically sensitive areas.

s) Caltrans shall ensure that storm/rain run-off that has come into contact with stockpiled lead-contaminated soil will not flow to storm drains, inlets, or waters of the State.

t) Caltrans may dispose of the lead-contaminated soil only within the operating right-of-way of an existing highway, as defined in Streets and Highways Code, section 23. Caltrans may move lead-contaminated soil from one Caltrans project to another Caltrans project only if the lead-contaminated soil remains within the same designated corridor.

Caltrans shall record any movement of lead-contaminated soil by using a bill of lading. The bill of lading must contain: 1) the US DOT description including shipping name, hazard class and ID number; 2) handling codes; 3) quantity of material; 4) volume of material; 5) date of shipment; 6) origin and destination of shipment; and 7) any specific handling instructions. The bill of lading shall be referenced in and kept on file with the project's as-built drawings. The lead-contaminated soil must be kept covered during transportation.

u) For each specific corridor where this variance is to be implemented, all of the following information shall be submitted in writing to DTSC at least five (5) days before construction of any project begins:

1. plan drawing designating the boundaries of the corridor where lead-contaminated soils will be excavated, stockpiled, buried and covered;
2. a list of the Caltrans projects that the corridor encompasses;
3. a list of Caltrans contractors that will be conducting any phase of work on any project affected by this variance;
4. duration of corridor construction;
5. location where sampling and analytical data used to make lead concentration level determinations are kept (e.g. a particular Caltrans project file);
6. name and phone number (including area code) of project resident engineer and project manager;
7. location where Caltrans and contractor health and safety plan and records are kept;

8. location of project special provisions (including page or section number) for soil excavation, transportation, stockpile, burial and placement of cover material;

9. location of project drawings (including drawing page number) for soil excavation, burial and placement of cover in plan and cross section (for example, "The project plans are located at the resident engineer's office located at 5th and Main Streets, City of Fresno, See pages xxxxx of contract xxx");

10. updated information if a Caltrans project within the corridor is added, changed or deleted; and

11. type of environmental document prepared for each project, date of adoption, document title, Clearing House number and where the document is available for review. A copy of the Caltrans Categorical Exemption, Categorical Exclusion Form, or if filed, the Notice of Exemption for any project shall be submitted to the DTSC Headquarters Project Manager.

v) Changes in location of lead-contaminated soil placement, quantities or protection measures (field changes) shall be noted in the resident engineer's project log within five (5) days of the field change.

w) Caltrans shall ensure that field changes are in compliance with the requirements of this variance.

x) Operational procedures described in the California Environmental Quality Act (CEQA) Special Initial Study shall be followed by Caltrans for activities conducted under this variance.

y) Caltrans shall implement appropriate health and safety procedures to protect its employees and the public, and to prevent or minimize exposure to potentially hazardous wastes. A project-specific health and safety plan must be prepared and implemented. The monitoring and exposure standards shall be based on construction standards for exposure to lead in California Code of Regulations, title 8, section 1532.1.

z) Caltrans shall provide a district Coordinator for this variance. This Coordinator will be the primary point of contact for information flowing to, or received from, DTSC regarding any matter or submission under this variance. Caltrans shall promptly notify DTSC of the name of Coordinator and any change in the Coordinator.

aa) Caltrans shall conduct regular inspections, consistent with Caltrans' Maintenance Division's current Pavement Inspection and Slope Inspection programs, of the locations where lead-contaminated soil has been buried and/or covered pursuant to this variance. If site inspection reveals deterioration of cover so that conditions in the variance are not met, Caltrans shall repair or replace the cover.

bb) Caltrans shall develop and implement a record keeping mechanisms to record and retain permanent records of all locations where lead-contaminated soil has been buried per this variance. The records shall be made available to DTSC.

cc) If areas subject to the terms of this variance are sold, relinquished or abandoned (including roadways), all future property owners shall be notified in writing in advance by Caltrans of the requirements of this variance, and Caltrans shall provide the owner with a copy of the variance. A copy of such a notice shall be sent to DTSC and contain the corridor location and project. Caltrans shall also disclose to DTSC and the new owner the location of areas where lead-contaminated soil has been buried. Future property owners shall be subject to the same requirements as Caltrans.

dd) For the purposes of informing the public about instances where the variance is implemented, Caltrans shall:

1. maintain current fact sheets at all Caltrans resident engineer offices and the Caltrans District office. Caltrans shall make the fact sheets available to anyone expressing an interest in variance-related work.
2. maintain a binder(s) containing copies of all reports submitted to DTSC at the District office. Caltrans shall ensure that the binders are readily accessible to the public.
3. carry out the following actions when it identifies additional projects:
 - (A) notify the public via a display advertisement in a newspaper of general circulation in that area.
 - (B) update and distribute the fact sheet to the mailing list and repository locations.

ee) Lead-contaminated soil may be buried only in areas where access is limited or where lead-contaminated soil is covered and contained by a pavement structure.

ff) Dust containing lead-contaminated soil must be controlled. Water or dust palliative may be applied to control dust. If visible dust migration occurs, all excavation, stockpiling and truck loading and burying must be stopped. The granting of this variance confers no relief on Caltrans from compliance with the laws, regulations and requirements enforced by any local air district or the California Air Resources Board.

gg) Sampling and analysis is required to show the lead-contaminated soil meets the variance criteria. All sampling and analysis must be conducted in accordance with the appropriate methods specified in U.S. EPA SW-846.

hh) DTSC retains the right to require Caltrans or any future owner to remove, and properly dispose of, lead-contaminated soil in the event DTSC determines it is necessary for protection of public health, safety or the environment.

ii) DTSC finds that some projects involving lead-contaminated soil are joint projects between Caltrans and other government entities. In these joint projects, Caltrans may not be the lead agency implementing the project although Caltrans is still involved if the project occurs on its right-of-way.

Caltrans may invoke this variance for joint projects where Caltrans and local government entity are involved provided that 1) the project is within the Caltrans Right-of-Way; 2) Caltrans reviews/ oversees all phases of the project including design, contracting, environmental assessment, construction, operation, and maintenance; and 3) Caltrans oversees the project to verify all variance conditions are complied with. Caltrans will be fully responsible for the variance notification and implementation in these joint projects.

jj) All correspondence shall be directed to the following office:

Hazardous Waste Permitting
Department of Toxic Substances Control
8800 Cal Center Drive
Sacramento, CA 95826

Attn: Caltrans Lead Variance Notification Unit

10. DISCLAIMER.

a) The issuance of this variance does not relieve Caltrans of the responsibility for compliance with Health and Safety Code, chapter 6.5, or the regulations adopted thereunder, and any other laws and regulations other than those specifically identified in Section 8 of this variance. Caltrans is subject to all terms and conditions herein. The granting of this variance confers no relief from compliance with any federal, State or local requirements other than those specifically provided herein.

b) The issuance of this variance does not release Caltrans from any liability associated with the handling of hazardous waste, except as specifically provided herein and subject to all terms and conditions of this variance.

11. VARIANCE MODIFICATION OR REVOCATION. This variance is subject to review at the discretion of DTSC and may be modified or revoked by DTSC upon change of ownership and at any other time pursuant to Health and Safety Code, section 25143.
12. CEQA DETERMINATION. DTSC adopted a Negative Declaration on June 30, 2009.

Table 1. California Human Health Screening Levels for Soil And Comparison To Other Potential Environmental Concerns

Chemical	¹ Soil Human Health Screening Levels (mg/kg of dry soil)		² Other Potential Environmental Concerns Posed By Contaminated Soil			
	Residential Land Use	Commercial/Industrial Land Use Only	³ Leaching	⁴ Ecotoxicity	⁵ Nuisance/Aesthetic Concerns	⁶ Other
Zinc	2.3E+04	1.0E+05	site specific	X	X	

Notes:

- Direct-exposure screening levels address human exposure to chemicals in soil via incidental ingestion, dermal absorption and inhalation of vapors and particulates emitted to outdoor air (refer to Appendix 1). Assumes impacted soil is situated at or near the ground surface or could be at some time in the future. Volatile chemicals not included at this time (refer to Section 2.5).
 "Residential Land Use" screening levels generally considered appropriate for other sensitive uses (e.g., day-care centers, hospitals, etc.). Commercial/Industrial properties should be evaluated using both residential and commercial/Industrial CHHSLs. A deed restriction that prohibits use of the property for sensitive purposes may be required at sites that are evaluated and/or remediated under a commercial/Industrial land use scenario only.
 Carcinogens: CHHSLs based on target cancer risk of 10⁻⁶. Cal/EPA cancer slope factors used when available.
 Noncarcinogens: CHHSLs based on target hazard quotient of 1.0.
 Calculation of cumulative risk may be required at sites where multiple contaminants with similar health effects are present (see Section 2.8).
 Residential and C/I soil CHHSLs for arsenic below background for most sites in California (0.07 mg/kg and 0.24 mg/kg, respectively - see Appendix 1). Use identified or anticipated background as screening level (see Section 2.7).
 Environmental concerns in addition to direct exposure that may need to be considered in evaluation of contaminated soil. Based on a comparison of soil CHHSLs to soil screening levels for noted concerns compiled by the San Francisco Bay Regional Water Quality Control Board (SFBRWQCB 2003). The need to address other environmental concerns must be evaluated separately in coordination with the lead regulatory agency (See Sections 1.4, 2.2 and Chapter 4).
 "X": Noted concern may outweigh direct-exposure risks at many sites and drive decisions for cleanup actions.
 "o": Potential concern but generally will be addressed if cleanup of contaminated soils to meet direct-exposure CHHSLs is carried out.
 "site specific": Potential concern, but evaluation as to whether this factor is a potential concern must be done on a site specific basis.
 Leaching of chemicals from soil and subsequent impacts to groundwater. Soil ESLs consider impacts to drinking water resources, re-emission of volatile chemicals from groundwater into overlying buildings and discharges of contaminated groundwater to surface water. Leaching of metals from soil should be evaluated on a site-specific basis, depending on the potential mobility of the metal species present. Laboratory-based leaching studies are generally preferred over model-derived screening levels.
 Toxicity to terrestrial flora and fauna. Need to consider ecotoxicity concerns generally determined on a site-by-site basis.
 Nuisance and gross contamination concerns address odors and aesthetic concerns as well as general resource degradation and presence of potentially mobile free product.
 Other pertinent environmental concerns and considerations as determined on a site-specific basis.
 Health risk to construction workers may outweigh risk to residents or commercial/Industrial workers for chemicals that are carcinogenic due to increased exposure to airborne dust particles and incidental ingestion of soil. Uptake of chemicals in edible fruits and vegetables from soil may need to be considered in some cases for noted chemicals.
 These metal salts are significantly (greater than 10-fold) more toxic than the values for the metals in general. If it is known that this chemical was used at the site, the screening number for this chemical should be used instead of the screening number for the metal and its compounds.
 Calculation of a screening number for the chemical has been postponed (pp) until the toxicity criterion currently being developed by OEHHA is published as a final document.
 This screening number is above the Total Threshold Limit Concentration for lead of 1000 mg/kg, as defined in Title 22, California Code of Regulations. It is also above the US EPA Region IX PRG of 800 mg/kg.

Revised California Human Health Screening Levels for Beryllium

Preface

In 2005, the California Office of Environmental Health Hazard Assessment (OEHHA) released a final document on the development of a list of soil screening numbers based on “protection of public health and safety” as required by Health and Safety Code Section 57008 (OEHHA, 2005). The screening numbers have no regulatory authority and are published solely as reference values that may be used by citizen groups, community organizations, property owners, developers, and local government officials to determine sites that would likely need no further action if a full risk assessment were conducted. How these soil screening levels should be applied is explained in “Use of California Human Health Screening Levels (CHHSLs) in Evaluation of Contaminated Properties,” (Cal/EPA, 2005).

Beryllium CHHSLs

For a CHHSL to be calculated, a chemical must have a toxicity criterion. A toxicity criterion mathematically relates a measure of exposure to a chemical to its toxic effect. For non-carcinogens it is generally the highest dose of the chemical not expected to cause a toxic effect. For a carcinogen it is the relationship between the risk of getting cancer caused by the chemical and the daily exposure to the chemical. In the OEHHA (2005) document, separate CHHSLs were developed for beryllium oxide, beryllium sulfate and all other forms of beryllium called “beryllium and compounds” because the three forms had different toxicity criteria. In 2005 the OEHHA Toxicity Criteria Database showed that all three were carcinogenic when inhaled. However, beryllium oxide and sulfate were considered carcinogenic when ingested, while “beryllium and compounds” was not. Residents and workers ingest far more soil at a site than the tiny amount that is inhaled after the soil is disturbed and becomes airborne dust. Therefore, the oral exposure generally drives the risk. This is why the CHHSLs for beryllium oxide and sulfate (considered carcinogenic when ingested) are so low compared to the CHHSL for beryllium and compounds (not considered carcinogenic when ingested)..

Beryllium Toxicity Criteria

The Toxicity Criteria Database is a Web site (www.oehha.ca.gov/risk/ChemicalDB/index.asp) that compiles the decisions of OEHHA’s ongoing evaluation of chemical toxicity. (The Integrated Risk Information System (IRIS) is the equivalent for the United States Environmental Protection Agency (USEPA) Web site). Toxicity criteria are based on a scientific study in which animals or humans have been exposed to several dose levels of the chemical and the incidence of adverse health effects has been measured. These scientific studies must meet certain criteria to be used.

Federal and California legislation in the mid 1980s required rapid criteria development of chemical toxicity at both levels of government. Some of these criteria were rescinded on reevaluation. The Beryllium Health Assessment document published in 1987 (USEPA, 1987) was the basis for oral cancer criteria for some forms of beryllium for both USEPA and

California. Shortly after the publication of the Beryllium Health Assessment document, both USEPA and OEHHA listed both oral and inhalation toxicity criteria for various forms of beryllium. USEPA reevaluated the 1987 Health Assessment document and scientific basis for calling beryllium oxide and beryllium sulfate carcinogenic by the oral route. The USEPA withdrew its oral potency factor on the April 3, 1998.

The USEPA toxicity criteria database (IRIS) has the following statement for beryllium and beryllium compounds, "The basis for not using the Schroeder and Mitchener rat study (1975a) is that the incidences of gross or malignant tumors in the control and beryllium-exposed groups were not significantly different." The Schroeder and Mitchener rat study (1975) was the previous basis for considering beryllium carcinogenic by the oral route. USEPA also stated, "The oral database is considered inadequate for the assessment of carcinogenicity." (IRIS, 1998). As a result, the IRIS Web site only lists a non-cancer Reference Dose (RfD) for oral exposure to beryllium.

Following the USEPA reevaluation, OEHHA reviewed the oral carcinogenicity for beryllium to determine a drinking water health goal (Public Health Goal; PHG). In the PHG document (OEHHA, 2003), OEHHA concurred with the USEPA decision and based the drinking water health goal for all beryllium compounds on a non-cancer effect. OEHHA states, "In this case the chemical is a known human carcinogen, based on exposures by the inhalation route, but oral cancer potency cannot be determined." (OEHHA, 2003).

The OEHHA PHG for beryllium is based on the same non-cancer scientific study used to determine the USEPA RfD, however, it is 10 times lower. This is because, after OEHHA identifies an appropriate study upon which to base the PHG, a No Observable Effect Level (NOAEL) is determined. OEHHA and USEPA identified the same NOAEL. The second step is to divide the NOAEL by an Uncertainty Factor (UF) that accounts for the uncertainty in extrapolating the NOAEL in animals to one for humans which was the same for OEHHA and USEPA. When OEHHA suspects that a chemical could cause cancer but lacks a credible study on which to base a cancer potency, the UF is increased 10-fold on the non-cancer criterion which was the case for beryllium. Therefore, the beryllium PHG is based on a toxicity criterion of 0.0002 mg/kg-d. The USEPA RfD, on which the 2005 beryllium and beryllium compounds is based, is 0.002 mg/kg-d.

Calculation of New Beryllium CHHSLs

Calculations are shown below for new CHHSL values for beryllium oxide, beryllium sulfate and "beryllium and compounds" and they will replace the values from the 2005 document. This is done in order to make the CHHSLs consistent with the most recent OEHHA toxicity evaluation. Two changes are required for consistency. First, the less health protective USEPA toxicity criterion of 0.002 mg/kg-d used to compute the 2005 beryllium and beryllium compounds CHHSL will be replaced with the toxicity criterion used to compute the OEHHA PHG. Second, none of the toxicity criteria used will be based on an oral cancer potency value.

Cancer Calculations

The OEHHA inhalation cancer slope factor for beryllium sulfate is $3000 \text{ (mg/kg-d)}^{-1}$. For all other beryllium compounds including beryllium oxide, the inhalation slope factor is $8.4 \text{ (mg/kg-d)}^{-1}$. The equations used to compute a CHHSL when an inhalation slope, but not an oral slope factor, is available is:

Residential CHHSL based on inhalation of cancer-causing dust

$$\text{CHHSL}_{\text{res}} = \frac{\text{TR} \times \text{AT} \times \text{PEF}}{\text{CSF}_i \times \text{EF}_r \times \left(\left(\frac{\text{IR}_a \times (\text{ED}_r - \text{ED}_c)}{\text{BW}_a} \right) + \left(\frac{\text{IR}_c \times \text{ED}_c}{\text{BW}_c} \right) \right)}$$

Where:

TR is the target risk - 10^{-6} (one in a million)

AT is 70 year lifetime in days called an averaging time 25550 days

PEF is the particulate emission factor - $1.316 \times 10^9 \text{ m}^3 \text{ air/kg soil}$

CSFi is the cancer slope factor for inhalation - $3000 \text{ (mg/kg-d)}^{-1}$ beryllium sulfate and $8.4 \text{ (mg/kg-d)}^{-1}$ for all other forms of beryllium including beryllium oxide.

IRa is the inhalation rate of an adult - $20 \text{ m}^3/\text{d}$

IRc is the inhalation rate of a child - $10 \text{ m}^3/\text{d}$

EFr is the exposure frequency for a resident - 350 days per year

EDr is the total exposure duration of a resident - 30 years

EDc is the exposure duration of a resident as a child - 6 years

BWa is the body weight of an adult - 70 kg

BWc is the body weight of an adult - 15 kg

Solving this residential equation modeling inhaled dust with these parameters for beryllium sulfate gives a CHHSL of 2.9 mg/kg. For all other forms of beryllium including beryllium oxide the CHHSL based on inhaled dust is 1043 mg/kg. CHHSLs are rounded to two significant figures yielding 2.9 and 1000 mg/kg, respectively.

Commercial/Industrial CHHSL based on inhalation of cancer-causing dust

$$\text{CHHSL}_{\text{ind}} = \frac{\text{TR} \times \text{AT} \times \text{PEF}}{\frac{\text{CSF}_i \times \text{IR}_w \times \text{EF}_w \times \text{ED}_w}{\text{BW}_w}}$$

Where:

TR is the target risk - 10^{-6} (one in a million)

AT is 70 year lifetime in days called an averaging time - 25550 days

PEF is the particulate emission factor - $1.316 \times 10^9 \text{ m}^3 \text{ air/kg soil}$

CSFi is the cancer slope factor for inhalation - $3000 \text{ (mg/kg-d)}^{-1}$ beryllium sulfate and $8.4 \text{ (mg/kg-d)}^{-1}$ for all other forms of beryllium including beryllium oxide.

IRw is the inhalation rate of an worker - $20 \text{ m}^3/\text{d}$

EFw is the exposure frequency for a worker - 250 days per year

EDw is the total exposure duration of a worker - 25 years

BWw is the body weight of a worker - 70 kg

Solving this industrial equation modeling inhaled dust with these parameters for beryllium sulfate gives a CHHSL of 6.3 mg/kg. For all other forms of beryllium including beryllium oxide the CHHSL based on inhaled dust is 2242 mg/kg. CHHSLs are rounded to two significant figures yielding 6.3 and 2200 mg/kg, respectively.

Non Cancer Calculations

The OEHHA PHG drinking water criterion is based on a RfD that is 10-fold less than the one published by the USEPA. This value is 0.002 mg/kg-d. This value is used in the calculations below.

Residential CHHSL based on noncancer health effects to a child

$$\text{CHHSL}_{\text{res}} = \frac{\text{THQ} \times \text{BW}_c \times 365}{\text{EF}_r \times \left(\left(\frac{\text{IRSc}}{\text{RfD}_{\text{oral}} \times 10^6} \right) + \left(\frac{\text{AF}_c \times \text{SA}_c \times \text{ABS}}{\text{RfD}_{\text{oral}} \times 10^6} \right) + \left(\frac{\text{IRAc}}{\text{RfD}_{\text{inh}} \times \text{PEF}} \right) \right)}$$

Where:

THQ is the target hazard quotient – 1.0

PEF is the particulate emission factor - $1.316 \times 10^9 \text{ m}^3 \text{ air/kg soil}$

RfDoral is the OEHHA reference dose for oral exposure - 0.0002 mg/kg-d

RfDinh is the USEPA reference dose for inhalation exposure - 0.00000571 mg/kg-d

IRc is the inhalation rate of a child - $10 \text{ m}^3/\text{d}$

IRSc is the soil ingestion rate of a child 200 mg/d

EFr is the exposure frequency for a resident - 350 days per year

EDc is the exposure duration of a resident as a child - 6 years

BWc is the body weight of a child - 15 kg

AFc is the soil to skin adherence factor for a child- 0.2 mg/cm^2

SAc is the surface area of skin to which soil can stick for a child – $2800 \text{ cm}^2/\text{d}$

ABS is the percent of chemical that can be absorbed through the skin -1%

Solving this residential equation modeling ingestion, inhalation and dermal contact with these parameters gives a CHHSL of 16 mg/kg.

Commercial/Industrial CHHSL based on noncancer health effects to a worker

$$CHHSL_{ind} = \frac{THQ \times BW_w \times 365}{EF_w \times \left(\left(\frac{IRS_w}{RfD_{oral} \times 10^6} \right) + \left(\frac{AF_w \times SA_w \times ABS}{RfD_{oral} \times 10^6} \right) + \left(\frac{IRA_w}{RfD_{inh} \times PEF} \right) \right)}$$

Where:

THQ is the target hazard quotient - 1.0

PEF is the particulate emission factor - 1.316×10^9 m³ air/kg soil

RfDoral is the OEHHA reference dose for oral exposure - 0.0002 mg/kg-d

RfDinh is the USEPA reference dose for inhalation exposure - 0.00000571 mg/kg-d

IRw is the inhalation rate of a worker - 20 m³/d

IRSw is the soil ingestion rate of a worker 100 mg/d

EFw is the exposure frequency for a worker - 250 days per year

EDw is the exposure duration of a resident as a worker - 25 years

BWw is the body weight of an adult - 70 kg

AFw is the soil to skin adherence factor for a worker- 0.2 mg/cm²

SAw is the surface area of skin to which soil can stick for a worker - 3300 cm²/d

ABS is the percent of chemical that can be absorbed through the skin -1%

Solving this industrial equation modeling ingestion, inhalation and dermal contact with these parameters gives a CHHSL of 190 mg/kg.

Conclusion

Summary of 2005 CHHSLs for Beryllium (mg/kg soil)

Scenario	Residential		Commercial/Industrial	
	Cancer	Non-cancer	Cancer	Non-cancer
Beryllium and Compounds	1000	150	2200	1700
Beryllium Oxide	0.091^a	150	0.41	1700
Beryllium Sulfate	0.00021	150	0.00095	1700

^a The values in bold are the 2005 CHHSLs for each compound and scenario.

Summary of Recalculated CHHSLs for Beryllium (mg/kg soil)

Scenario	Residential		Commercial/Industrial	
	Cancer	Non-cancer	Cancer	Non-cancer
Beryllium and Compounds	1000	16	2200	190
Beryllium Oxide	1000	16	2200	190
Beryllium Sulfate	2.9	16	6.3	190

Because the inadvertent ingestion of soil drives these calculations, eliminating the oral cancer potencies for beryllium oxide and beryllium sulfate dramatically increases the CHHSLs based on carcinogenicity from those published previously. Likewise, decreasing the oral RfD by a factor of 10 reduced the new CHHSLs based on non-cancer effects for beryllium and beryllium compounds 10-fold.

Summary of Updated 2008 CHHSLs for Beryllium (mg/kg soil)

Scenario	Residential	Commercial/Industrial
Beryllium Sulfate	2.9	6.3
All Other Beryllium Compounds	16	190

The residential CHHSL for beryllium sulfate is 2.9 mg/kg and the industrial CHHSL is 6.3 mg/kg. For all other forms of beryllium (including beryllium oxide), the non-cancer residential value of 16 is lower than the cancer residential value of 1000. Therefore, the residential CHHSL is 16 mg/kg. For all other forms of beryllium (including beryllium oxide), the non-cancer commercial/industrial value of 190 is lower than the cancer commercial/industrial value of 2200 mg/kg. Therefore, the commercial/industrial CHHSL is 190 mg/kg.

Appendix

Reponses to Comments Received on the September 2008 Review Draft Report

Dr. Jean Rabovsky representing herself.

Dr. Rabovsky points out that the document is unclear. The table showing the candidate CHSSLs did not include values for non-cancer endpoints for beryllium sulfate or beryllium oxide. She was concerned that the Office of Environmental Health Hazard Assessment (OEHHA) did not consider non-cancer endpoints. The revised tables have all values to avoid confusion.

Mr. Lawrence Szuhay representing Brush Wellman, Inc.

Mr. Szuhay had two comments:

1. In 2003, OEHHA should not have adopted the Public Health Goal (PHG) with the additional 10-fold safety factor. He believes that this is “improper and unnecessarily conservative.”
2. OEHHA should not compute a CHHSL for beryllium based on a cancer endpoint for inhalation.

Mr. Szuhay provided extensive written material in support of his two comments. Unfortunately, the two comments do not pertain to the action taken. OEHHA did not reevaluate the basis of either the beryllium PHG or the inhalation slope factor for any forms of beryllium as part of the CHHSL development process. Both the PHG and inhalation slope factors underwent a public comment period culminating in the adoption of the existing criteria in earlier actions by OEHHA that were not part of the CHHSL development process.

OEHHA eliminated oral cancer potency values for beryllium oxide and beryllium sulfate based on the findings of the 2003 beryllium PHG. In addition, OEHHA choose to use the reference dose developed for the PHG in 2003 instead of the U.S. Environmental Protection Agency’s Integrated Risk Information System (IRIS) criterion.

Revised California Human Health Screening Level for Lead

Introduction

The California Office of Environmental Health Hazard Assessment (OEHHA) has recently developed a 1 µg/dL benchmark for source-specific incremental change in blood lead levels for protection of school children and fetuses (OEHHA, 2007). The publication of this value required a review of the residential Soil Screening Level for lead (CHHSL), which currently stands at 150 mg/kg and the commercial/industrial CHHSL, which currently stands at 3500 mg/kg (OEHHA, 2005 revision). Application of this Soil Screening Level is explained in “Use of California Human Health Screening Levels in Evaluation of Contaminated Properties” (Cal/EPA, 2005).

Methods

The essence of this task was to estimate a concentration in soil that would lead to an incremental increase in blood lead (Pb_B) of up to 1 µg/dL, in people exposed to that soil. For the residential CHHSL for lead we evaluated the exposure to a child resident. For the commercial/industrial CHHSL we evaluated the exposure to a pregnant adult worker.

Residential Child Scenario

The Department of Toxic Substances Control’s Leadsread model (DTSC, 2007) was used to estimate blood lead concentrations in children. The Leadsread model considers exposure to lead in soil by three pathways: ingestion, re-suspension and inhalation, and dermal contact. The Leadsread model was queried for the soil lead concentrations that would give rise to a 90th percentile estimate of increase in blood lead of 1 µg/dL using the “goal seek” function in Excel™. Model inputs and outputs for the Child Scenario are shown in Table 1.

Table 1: Leadsread Input Values

FACTOR	LEVEL	UNITS
Lead in Soil/Dust	77	µg/g
Soil ingestion	100	mg/day
Ingestion constant	0.16	(µg/dl)/(µg/day)
Oral bioavailability	0.44	unitless
Skin area	2900	cm ²
Soil adherence	200	µg/cm ²
Dermal uptake constant	0.0001	(µg/dl)/(µg/day)
Respirable dust	1.5	ug/m ³
Breathing rate	6.8	m ³ /day
Inhalation constant	0.192	(µg/dl)/(µg/day)
Exposure days per week	7	days/wk
Geometric Standard Deviation ¹	1.6	µg/dL
Background lead in air ²	0	µg/m ³
Lead in water ²	0	µg/L
Home-grown produce ³	0	percent
Resulting 90 th percentile increase in blood lead	1	µg/dL

¹ Based on blood lead levels in geographically limited populations of children (EPA, 2007)

² Because this soil screening level is based on a change in blood lead due to the exposure under evaluation, no background exposures are included.

³ As explained in (OEHHA, 2005) the food pathway is not used in calculating soil screening levels. These screening levels may not be appropriate for sites to be used for gardening or farming.

Occupational Adult Scenario

U.S. EPA's Adult Lead Model (ALM) (EPA, 2005) was used to estimate the blood lead concentration in a fetus of an adult worker exposed to lead-contaminated soil. The model was queried directly for the soil lead concentrations that would give rise to the 90th percentile estimate of change in blood lead of 1 µg/dL using the "goal seek" function in ExcelTM. Model inputs and outputs are shown in Table 2. Inputs that were changed from default values are in bold.

Table 2: ALM Input and Output Values for the Occupational Scenario

FACTOR	UNITS	VALUE
Fetal/maternal Pb _B ratio	--	0.9
Biokinetic Slope Factor	µg/dL per µg/day	0.4
Geometric standard deviation Pb _B (GSD)	--	1.8 ²
Baseline Pb _B	µg/dL	0.0 ³
Soil ingestion rate (including soil-derived indoor dust)	g/day	0.050
Absorption fraction	--	0.12
Exposure frequency	days/yr	250 ⁴
Averaging time	days/yr	365
Pb _B of adult worker, geometric mean	µg/dL	0.6 ¹
90th percentile Pb _B among fetuses of adult workers	µg/dL	1.0
Target Pb _B level of concern	µg/dL	1.0
Probability that fetal Pb _B > Pb _{Bt} , assuming lognormal distribution	percent	10 %
Soil lead concentration	µg/g or ppm	320 ¹

¹ Calculated value

² The default GSD in ALM (2.1) was changed to 1.8. EPA (2001) recommended a value of 1.8 for relatively homogeneous populations. The default GSD in ALM reflects variability in the population as a whole. This variability has many components, including variability in exposure concentration. The latter source of variability is reduced or eliminated in a population exposed to soil containing 320 ppm.

³ No baseline Pb_B is assumed, since the target change in blood lead is an incremental change due to the soil in question.

⁴ The value of 250 days per year is consistent with other CHHSLs.

Results

The Soil Screening Levels resulting from the analyses described above are shown in Table 3.

Table 3: Comparison of 2005 CHHSLs to Revised CHHSLs

Residential CHHSL* (mg/kg)		Commercial/Industrial CHHSL ¹ (mg/kg)	
2005	Revised	2005	Revised
150	80	3500	320

¹ Rounded to nearest multiple of 10.

Discussion

The previous CHHSLs for lead were calculated as the maximum soil concentration which, combined with an assumed background lead exposure from food, air, and water, would result in a total blood lead not to exceed 10 $\mu\text{g}/\text{dl}$. The proposed CHHSLs are calculated differently: they are calculated as the level in soil that could result in up to a 1 $\mu\text{g}/\text{dl}$ increase in blood lead, irrespective of background exposures. Background exposures are not typically considered in other CHHSLs or other screening levels.

The proposed CHHSLs for lead consider two sources of uncertainty: the relationship between blood lead level and cognitive ability, and the relationship between lead levels in the environment and blood lead levels. The first source of uncertainty involves the fitting of a model to the blood lead and IQ data in the meta-analysis of Lanphear et al. (2005) that was used to determine the relationship between blood lead and IQ. To be conservative OEHHA (2007) used a 97.5% upper confidence limit on the slope of the IQ versus Pb_B curve.

The other source of uncertainty is the relationship between environmental lead levels and blood lead levels. Both Leadsread and the ALM account for this by predicting a distribution of blood lead values for any given set of environmental inputs. The percentiles of the Pb_B versus soil Pb curve reflect physiological and behavioral variability in individual responses to similar environmental concentrations. Although the previous CHHSL for lead was based on the 99th percentile of that distribution, the revised CHHSL is based on the 90th percentile of the distribution. The reason for this change is that the benchmark change in blood lead concentration is a health-protective estimate, based on risk to children, whereas the previous target blood lead level was based on a “level of concern” that did not incorporate recent scientific information and focused on individual - rather than population - risks.

The overall approach to accommodating the two sources of uncertainty can be summarized as follows: the CHHSLs represent concentrations in soil that have no more than a 2.5% probability of decreasing IQ by more than 1 point in a 90th percentile child or fetus.

Appendix

Response to comments

OEHHA received two comments on the draft CHHSL for lead. Both commentors suggested that the lead CHHSL should be applied only to anthropogenic lead, i.e. that background lead should not be included.

OEHHA response: In its response to comment #48 to the original 2005 CHHSL document, OEHHA stated “The health-based screening number for arsenic is intended for arsenic contamination resulting from human activity.” This could also be applied to lead and other elements. However, the final determination of background levels and how they will be accounted for in any site-specific decision is ultimately up to those making the site-specific decision.

Re: ATL Work Order Number : 1203892
Client Reference : Los Angeles Route 2, S9475-06-22

Enclosed are the results for sample(s) received on November 06, 2012 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

A handwritten signature in black ink, appearing to read 'Eddie Rodriguez', with a small 'Er' monogram below it.

Eddie Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and its absence renders the report invalid. Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Conference and/or applicable state-specific certification programs. The report cannot be reproduced without written permission from the client and Advanced Technology Laboratories.

CASE NARRATIVE

Results were J-flagged. "J" is used to flag those results that are between the PQL (Practical Quantitation Limit) and the calculated MDL (Method Detection Limit). Results that are "J" flagged are estimated values since it becomes difficult to accurately quantitate the analyte near the MDL.

Notes and Definitions

- R RPD value outside acceptance criteria. Calculation is based on raw values.
- M1 Matrix spike recovery outside of acceptance limit. The analytical batch was validated by the laboratory control sample.
- J Analyte detected below the Practical Quantitation Limit but above or equal to the Method Detection Limit. Result is an estimated concentration.
- ND Analyte not detected at or above reporting limit
- PQL Practical Quantitation Limit
- MDL Method Detection Limit
- NR Not Reported
- RPD Relative Percent Difference
- CA1 CA-NELAP (CDPH)
- CA2 CA-ELAP (CDPH)
- OR1 OR-NELAP (OSPHL)
- TX1 TX-NELAP (TCEQ)

Notes:

(1) The reported MDL and PQL are based on prep ratio variation and analytical dilution.

Special Instructions/Comments:
CT Contract 07A2729
Run samples for total lead and STLC. STLC results greater than 5.0 mg/l will be analyze with the soluble lead test by WET using de-ionized water (DI-WET) as the extractant. Report MDLs and PQLs

Storage Fees (applies when storage is requested):
 Sample: \$2.00 / sample / mo (after 45 days)
 Records: \$1 / ATL workorder / mo (after 1 year)

Sample Records - Archival & Disposal
 Unless otherwise requested by client, all samples will be disposed 45 days after receipt and records will be disposed 1 year after submittal of final report.

Re: ATL Work Order Number : 1203892
Client Reference : Los Angeles Route 2, S9475-06-22

Enclosed are the results for sample(s) received on November 06, 2012 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

A handwritten signature in black ink, appearing to be "E. Rodriguez".

Eddie Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and its absence renders the report invalid. Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Conference and/or applicable state-specific certification programs. The report cannot be reproduced without written permission from the client and Advanced Technology Laboratories.

SUMMARY OF SAMPLES

Sample ID	Laboratory ID	Matrix	Date Sampled	Date Received
1190-102-0.0	1203892-05	Soil	11/06/12 9:48	11/06/12 15:19
1190-104-0.0	1203892-09	Soil	11/06/12 11:35	11/06/12 15:19
1190-104-1.0	1203892-10	Soil	11/06/12 11:37	11/06/12 15:19
1190-105-0.0	1203892-13	Soil	11/06/12 12:20	11/06/12 15:19
1190-105-3.5	1203892-16	Soil	11/06/12 12:41	11/06/12 15:19

CASE NARRATIVE

Results were J-flagged. "J" is used to flag those results that are between the PQL (Practical Quantitation Limit) and the calculated MDL (Method Detection Limit). Results that are "J" flagged are estimated values since it becomes difficult to accurately quantitate the analyte near the MDL.

Sample Receiving/General Comments

Sample amount used for TCLP analysis by EPA 1311 is less than the amount required by the method. The client was notified on 11/29/12.

Notes and Definitions

- R RPD value outside acceptance criteria. Calculation is based on raw values.
- M1 Matrix spike recovery outside of acceptance limit. The analytical batch was validated by the laboratory control sample.
- J Analyte detected below the Practical Quantitation Limit but above or equal to the Method Detection Limit. Result is an estimated concentration.
- ND Analyte not detected at or above reporting limit
- PQL Practical Quantitation Limit
- MDL Method Detection Limit
- NR Not Reported
- RPD Relative Percent Difference
- CA1 CA-NELAP (CDPH)
- CA2 CA-ELAP (CDPH)
- OR1 OR-NELAP (OSPHL)
- TX1 TX-NELAP (TCEQ)

Notes:

(1) The reported MDL and PQL are based on prep ratio variation and analytical dilution.

Subject: FW: geocon project number S9475-06-22 - additional analysis
Attachments: S9475-06-22 ATL Add Analysis.xlsx

Hi Diane,

We would like to run the test indicated with an "X" on the attached table. These samples are for Geocon project number S9475-06-22. ATL work order nos. 1203892, 1203893, 1203922, and 1203954.

Let me know if you have questions.

Re: ATL Work Order Number : 1203893
Client Reference : Los Angeles Route 2, S9475-06-22

Enclosed are the results for sample(s) received on November 06, 2012 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

A handwritten signature in black ink, appearing to read "Eddie Rodriguez".

Eddie Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and its absence renders the report invalid. Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Conference and/or applicable state-specific certification programs. The report cannot be reproduced without written permission from the client and Advanced Technology Laboratories.

CASE NARRATIVE

Results were J-flagged. "J" is used to flag those results that are between the PQL (Practical Quantitation Limit) and the calculated MDL (Method Detection Limit). Results that are "J" flagged are estimated values since it becomes difficult to accurately quantitate the analyte near the MDL.

Notes and Definitions

- R RPD value outside acceptance criteria. Calculation is based on raw values.
- M1 Matrix spike recovery outside of acceptance limit. The analytical batch was validated by the laboratory control sample.
- J Analyte detected below the Practical Quantitation Limit but above or equal to the Method Detection Limit. Result is an estimated concentration.
- ND Analyte not detected at or above reporting limit
- PQL Practical Quantitation Limit
- MDL Method Detection Limit
- NR Not Reported
- RPD Relative Percent Difference
- CA1 CA-NELAP (CDPH)
- CA2 CA-ELAP (CDPH)
- OR1 OR-NELAP (OSPHL)
- TX1 TX-NELAP (TCEQ)

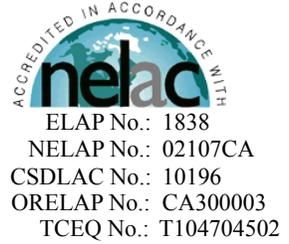

Notes:

(1) The reported MDL and PQL are based on prep ratio variation and analytical dilution.

Enclosed are the results for sample(s) received on November 06, 2012 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

A handwritten signature in black ink, appearing to read 'E Rodriguez', is written over a light gray rectangular background.

Eddie Rodriguez
Laboratory Director

SUMMARY OF SAMPLES

Sample ID	Laboratory ID	Matrix	Date Sampled	Date Received
1190-115-0	1203893-01	Soil	11/06/12 11:50	11/06/12 15:19

CASE NARRATIVE

Results were J-flagged. "J" is used to flag those results that are between the PQL (Practical Quantitation Limit) and the calculated MDL (Method Detection Limit). Results that are "J" flagged are estimated values since it becomes difficult to accurately quantitate the analyte near the MDL.

Sample Receiving/General Comments

Sample amount used for TCLP analysis by EPA 1311 is less than the amount required by the method. The client was notified on 11/29/12.

Hi Diane,

We would like to run the test indicated with an "X" on the attached table. These samples are for Geocon project number S9475-06-22. ATL work order nos. 1203892, 1203893, 1203922, and 1203954.

Let me know if you have questions.

Enclosed are the results for sample(s) received on November 07, 2012 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

A handwritten signature in black ink, appearing to read "Eddie Rodriguez", with a small "Er" monogram below it.

Eddie Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and its absence renders the report invalid. Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Conference and/or applicable state-specific certification programs. The report cannot be reproduced without written permission from the client and Advanced Technology Laboratories.

CASE NARRATIVE

Results were J-flagged. "J" is used to flag those results that are between the PQL (Practical Quantitation Limit) and the calculated MDL (Method Detection Limit). Results that are "J" flagged are estimated values since it becomes difficult to accurately quantitate the analyte near the MDL.

Certificate of Analysis

Geocon Consultants, Inc.

3303 N. San Fernando Blvd., Suite 100

Burbank, CA 91504

Project Number : Los Angeles Route 2, S9475-06-22

Report To : Mike Conkle

Reported : 11/21/2012

Notes and Definitions

R	RPD value outside acceptance criteria. Calculation is based on raw values.
M1	Matrix spike recovery outside of acceptance limit. The analytical batch was validated by the laboratory control sample.
J	Analyte detected below the Practical Quantitation Limit but above or equal to the Method Detection Limit. Result is an estimated concentration.
ND	Analyte not detected at or above reporting limit
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
NR	Not Reported
RPD	Relative Percent Difference
CA1	CA-NELAP (CDPH)
CA2	CA-ELAP (CDPH)
OR1	OR-NELAP (OSPHL)
TX1	TX-NELAP (TCEQ)

Notes:

(1) The reported MDL and PQL are based on prep ratio variation and analytical dilution.

Re: ATL Work Order Number : 1203922
Client Reference : Los Angeles Route 2, S9475-06-22

Enclosed are the results for sample(s) received on November 07, 2012 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

A handwritten signature in black ink, appearing to read "E Rodriguez".

Eddie Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and its absence renders the report invalid. Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Conference and/or applicable state-specific certification programs. The report cannot be reproduced without written permission from the client and Advanced Technology Laboratories.

SUMMARY OF SAMPLES

Sample ID	Laboratory ID	Matrix	Date Sampled	Date Received
1190-116-0.0	1203922-01	Soil	11/07/12 8:42	11/07/12 14:06
1190-117-0.0	1203922-05	Soil	11/07/12 9:37	11/07/12 14:06
1190-118-0.0	1203922-09	Soil	11/07/12 10:31	11/07/12 14:06
1190-119-0.0	1203922-13	Soil	11/07/12 11:08	11/07/12 14:06

CASE NARRATIVE

Results were J-flagged. "J" is used to flag those results that are between the PQL (Practical Quantitation Limit) and the calculated MDL (Method Detection Limit). Results that are "J" flagged are estimated values since it becomes difficult to accurately quantitate the analyte near the MDL.

Sample Receiving/General Comments

Sample amount used for TCLP analysis by EPA 1311 is less than the amount required by the method. The client was notified on 11/29/12.

Notes and Definitions

- R RPD value outside acceptance criteria. Calculation is based on raw values.
- M1 Matrix spike recovery outside of acceptance limit. The analytical batch was validated by the laboratory control sample.
- J Analyte detected below the Practical Quantitation Limit but above or equal to the Method Detection Limit. Result is an estimated concentration.
- ND Analyte not detected at or above reporting limit
- PQL Practical Quantitation Limit
- MDL Method Detection Limit
- NR Not Reported
- RPD Relative Percent Difference
- CA1 CA-NELAP (CDPH)
- CA2 CA-ELAP (CDPH)
- OR1 OR-NELAP (OSPHL)
- TX1 TX-NELAP (TCEQ)

Notes:

(1) The reported MDL and PQL are based on prep ratio variation and analytical dilution.

Hi Diane,

We would like to run the test indicated with an "X" on the attached table. These samples are for Geocon project number S9475-06-22. ATL work order nos. 1203892, 1203893, 1203922, and 1203954.

Let me know if you have questions.

Re: ATL Work Order Number : 1203954
Client Reference : Los Angeles Route 2, S9475-06-22

Enclosed are the results for sample(s) received on November 08, 2012 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

A handwritten signature in black ink, appearing to read 'Eddie Rodriguez', with a small 'Er' monogram below it.

Eddie Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and its absence renders the report invalid. Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Conference and/or applicable state-specific certification programs. The report cannot be reproduced without written permission from the client and Advanced Technology Laboratories.

Certificate of Analysis

Geocon Consultants, Inc.

3303 N. San Fernando Blvd., Suite 100

Burbank, CA 91504

Project Number : Los Angeles Route 2, S9475-06-22

Report To : Mike Conkle

Reported : 11/21/2012

CASE NARRATIVE

Results were J-flagged. "J" is used to flag those results that are between the PQL (Practical Quantitation Limit) and the calculated MDL (Method Detection Limit). Results that are "J" flagged are estimated values since it becomes difficult to accurately quantitate the analyte near the MDL.

Notes and Definitions

- R RPD value outside acceptance criteria. Calculation is based on raw values.
- M1 Matrix spike recovery outside of acceptance limit. The analytical batch was validated by the laboratory control sample.
- J Analyte detected below the Practical Quantitation Limit but above or equal to the Method Detection Limit. Result is an estimated concentration.
- ND Analyte not detected at or above reporting limit
- PQL Practical Quantitation Limit
- MDL Method Detection Limit
- NR Not Reported
- RPD Relative Percent Difference
- CA1 CA-NELAP (CDPH)
- CA2 CA-ELAP (CDPH)
- OR1 OR-NELAP (OSPHL)
- TX1 TX-NELAP (TCEQ)

Notes:

(1) The reported MDL and PQL are based on prep ratio variation and analytical dilution.

Special Instructions/Comments:
 CT Contract 07A2729
 Run samples for total lead and STLC. STLC results greater than 5.0 mg/l will be analyze with the soluble lead test by WET using de-ionized water (DI-WET) as the extractant. Report MDLs and PQLs. Filter and preserve water samples at the Lab.

Re: ATL Work Order Number : 1203954
Client Reference : Los Angeles Route 2, S9475-06-22

Enclosed are the results for sample(s) received on November 08, 2012 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

A handwritten signature in black ink, appearing to read "Eddie Rodriguez", with a small "Er" monogram below it.

Eddie Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and its absence renders the report invalid. Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Conference and/or applicable state-specific certification programs. The report cannot be reproduced without written permission from the client and Advanced Technology Laboratories.

CASE NARRATIVE

Results were J-flagged. "J" is used to flag those results that are between the PQL (Practical Quantitation Limit) and the calculated MDL (Method Detection Limit). Results that are "J" flagged are estimated values since it becomes difficult to accurately quantitate the analyte near the MDL.

Notes and Definitions

M1	Matrix spike recovery outside of acceptance limit. The analytical batch was validated by the laboratory control sample.
J	Analyte detected below the Practical Quantitation Limit but above or equal to the Method Detection Limit. Result is an estimated concentration.
ND	Analyte not detected at or above reporting limit
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
NR	Not Reported
RPD	Relative Percent Difference
CA1	CA-NELAP (CDPH)
CA2	CA-ELAP (CDPH)
OR1	OR-NELAP (OSPHL)
TX1	TX-NELAP (TCEQ)

Notes:

(1) The reported MDL and PQL are based on prep ratio variation and analytical dilution.

Subject: FW: geocon project number S9475-06-22 - additional analysis
Attachments: S9475-06-22 ATL Add Analysis.xlsx

Hi Diane,

We would like to run the test indicated with an "X" on the attached table. These samples are for Geocon project number S9475-06-22. ATL work order nos. 1203892, 1203893, 1203922, and 1203954.

Let me know if you have questions.

95% Standard Bootstrap UCL	211.1

SUMMARY OF STATISTICAL ANALYSIS
 EA 07-205521
 ROUTE 2 GLENDALE BOULEVARD UC TO ROSEBUD AVENUE UC
 LOS ANGELES COUNTY, CALIFORNIA

NORTHBOUND SOUNDWALLS 560 AND 570
Borings 1190-101 through 1190-107

Sample Interval (feet)	90% UCL		95% UCL	
	Total Lead (mg/kg)	Soluble (WET) Lead * (mg/l)	Total Lead (mg/kg)	Soluble (WET) Lead * (mg/l)
0.0 to 0.5	321.8	23.6	348.0	25.5
1.0 to 1.5	204.0	15.0	223.7	16.4
2.0 to 2.5	101.1	7.4	110.5	8.1
3.0 to 5.0	194.9	14.3	211.1	15.5

Excavation Scenarios

Excavation Depth	90% UCL		95% UCL	
	Total Lead (mg/kg)	Soluble (WET) Lead * (mg/l)	Total Lead (mg/kg)	Soluble (WET) Lead * (mg/l)
0.0 to 0.5 foot	321.8	23.6	348.0	25.5
Underlying Soil (0.5 to 5.0 feet)	190.2	13.9	206.8	15.2
0.0 to 1.5 feet	282.5	20.7	306.6	22.5
Underlying Soil (1.5 to 5.0 feet)	169.4	12.4	184.2	13.5
0.0 to 2.5 feet	230.5	16.9	250.8	18.4
Underlying Soil (2.5 to 5.0 feet)	176.1	12.9	191.0	14.0
0.0 to 5.0 feet	203.3	14.9	220.9	16.2

Notes:

UCL = Upper Confidence Level

90% UCL applicable for waste classification and onsite reuse

95% UCL applicable for risk assessment and offsite disposal

mg/kg = milligrams per kilogram

mg/l = milligrams per liter

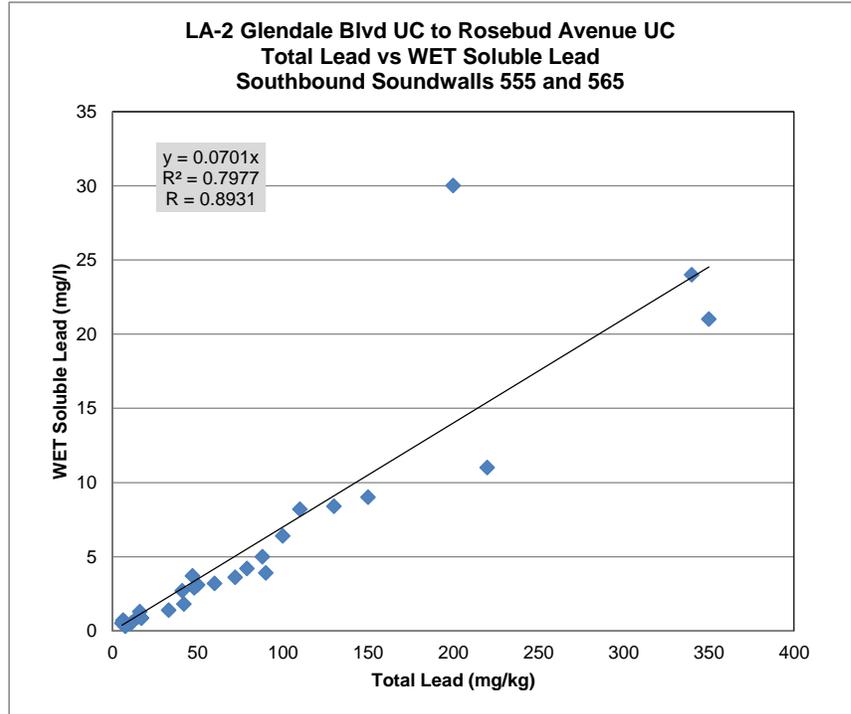

* = Soluble (WET) lead concentrations were predicted using slope of the regression line,
 where y = predicted soluble (WET) lead and x = total lead

Regression Line Slope: $y = 0.0733 x$
